**Background.** The chicken is the most abundant food animal in the world. However, despite its importance, the chicken gut microbiome remains largely undefined. Here, we exploit culture-independent and culture-dependent approaches to reveal extensive taxonomic diversity within complex microbial community.

**Results.** We performed metagenomic sequencing of fifty chicken faecal samples from two breeds and analysed these, alongside all (n=582) relevant publicly available chicken metagenomes, to cluster over 20 million non-redundant genes and to construct over 5,500 metagenome-assembled bacterial genomes. In addition, we recovered nearly 600 bacteriophage genomes. This represents the most comprehensive view of taxonomic diversity within the chicken gut microbiome to date, encompassing hundreds of novel candidate bacterial genera and species. To provide a stable, clear and memorable nomenclature for novel species, we devised a scalable combinatorial system for the creation of hundreds of well-formed Latin binomials. We cultured and genome-sequenced bacterial isolates from chicken faeces, documenting over forty novel species, together with three species from the genus *Escherichia*, including the newly named species *Escherichia whittamii*.

**Conclusions.** Our metagenomic and culture-based analyses provide new insights into the bacterial, archaeal and bacteriophage components of the chicken gut microbiome. The resulting datasets expand the known diversity of the chicken gut microbiome and provide a key resource for future high-resolution taxonomic and functional studies on the chicken gut microbiome.

25

26 **Abstract**

27 **Background.** The chicken is the most abundant food animal in the world. However, despite  
28 its importance, the chicken gut microbiome remains largely undefined. Here, we exploit  
29 culture-independent and culture-dependent approaches to reveal extensive taxonomic  
30 diversity within complex microbial community.

31 **Results.** We performed metagenomic sequencing of fifty chicken faecal samples from two  
32 breeds and analysed these, alongside all (n=582) relevant publicly available chicken  
33 metagenomes, to cluster over 20 million non-redundant genes and to construct over 5,500  
34 metagenome-assembled bacterial genomes. In addition, we recovered nearly 600  
35 bacteriophage genomes. This represents the most comprehensive view of taxonomic diversity  
36 within the chicken gut microbiome to date, encompassing hundreds of novel candidate  
37 bacterial genera and species. To provide a stable, clear and memorable nomenclature for  
38 novel species, we devised a scalable combinatorial system for the creation of hundreds of  
39 well-formed Latin binomials. We cultured and genome-sequenced bacterial isolates from  
40 chicken faeces, documenting over forty novel species, together with three species from the  
41 genus *Escherichia*, including the newly named species *Escherichia whittamii*.

42 **Conclusions.** Our metagenomic and culture-based analyses provide new insights into the  
43 bacterial, archaeal and bacteriophage components of the chicken gut microbiome. The  
44 resulting datasets expand the known diversity of the chicken gut microbiome and provide a  
45 key resource for future high-resolution taxonomic and functional studies on the chicken gut  
46 microbiome.

## 47 Introduction

48 The domestic chicken is the most abundant bird and most abundant food animal on Earth,  
49 accounting for a larger fraction of the planet's biomass than all species of wild birds combined  
50 (Bennett et al., 2018). Consumption of chicken meat is growing faster than any other type of  
51 meat and is seen as a cheaper, healthier, low-carbon alternative to meat from mammalian  
52 livestock (Eshel et al., 2014; Willett et al., 2019). Chicken eggs remain a nutritious, affordable  
53 food across the globe (Réhault-Godbert et al., 2019).

54 The chicken gastrointestinal tract is home to a complex community of microbes and their  
55 genes—the chicken gut microbiome—that underpins links between diet, health and productivity  
56 in poultry, as evidenced by the ability of antibiotics to promote growth in chicks (Bedford,  
57 2000). This microbial community also acts as a source of pathogens associated with disease in  
58 birds or in humans—including *Campylobacter*, *Salmonella*, and *Escherichia coli*—as well as  
59 providing a reservoir of antimicrobial resistance genes (Florez-Cuadrado et al., 2018; Jørgensen  
60 et al., 2019; Hermans et al., 2012).

61 Previous studies of this community have documented a rich variety of microorganisms  
62 (dominated by bacteria, but including viruses, archaea and microbial eukaryotes) and have  
63 shown that the taxonomic composition of this community varies with age, breed and disease  
64 status (Shang et al., 2018; Rychlik, 2020). However, these earlier efforts have largely relied on  
65 analyses of molecular barcodes (in particular short 16S rRNA gene sequences), which fail to  
66 provide species-level resolution, are unable to detect viruses and reveal nothing about the  
67 genome sequences, population structures or functional repertoires of microbial species (Hillmann  
68 et al., 2018).

69 Two strategies have proven productive for exploring taxonomic and functional diversity in  
70 complex microbial communities (Almeida et al., 2019; Forster et al., 2019). Culture-independent  
71 approaches rely on shotgun metagenomic sequencing of DNA extracted from relevant samples,  
72 followed by bioinformatics-based community profiling and analysis (Glendinning et al., 2020;  
73 Sergeant et al., 2014). Culture-dependent approaches combine large-scale isolation of  
74 microorganisms in pure culture with whole-genome sequencing and phylogenomic analysis  
75 (Medvecky et al., 2018). To explore taxonomic novelty in the chicken gut microbiome, we  
76 generated phylogenetic profiles to document known and unknown diversity and then exploited  
77 culture-dependent and culture-independent approaches to create an unprecedented high-quality  
78 reference collection of microbial genes and genomes from the chicken gut, revealing and naming  
79 hundreds of new candidate species from this commonplace but important ecological setting.

80

## 81 Materials & Methods

### 82 Sample collection and storage

83 Faecal samples were collected in South-East England from adult Lohmann Brown laying hens  
84 and adult Silkie hens in 2018. Birds were housed in a large outdoor run with a substrate of stone  
85 chippings and small turf enrichment beds during the day and kept in a coop overnight. They were  
86 fed a commercial layer feed, Farmgate Layer pellets and mash (ForFarmers UK Limited,  
87 Rougham, Bury St Edmunds), according to the manufacturer's instructions and no antibiotics  
88 were used. Faecal sampling was approved by the University of Surrey's NASPA ethics  
89 committee.

90 Sixty faecal samples were collected from the Lohmann Brown laying hens and thirty samples  
91 from the Silkie hens (six and three samples per day, respectively, for ten days). Freshly  
92 evacuated faeces from individual birds were collected in sterile containers and immediately

93 stored at -20 °C. Samples were then transferred to the laboratory for culture or DNA extraction.  
94 DNA was extracted using DNeasy PowerSoil kit (Qiagen), following manufacturer's instructions  
95 and then stored at -20°C.  
96

### 97 **Sequencing and subsequent workflow**

98 Workflow from this point forward is summarised in Fig. 1. The fifty samples yielding >20 ng  
99 DNA were processed according to the Low Input, Transpose Enabled (LITE) library  
100 construction pipeline (Perez-Sepulveda et al., 2020) before being subjected to paired-end  
101 (2x150bp) metagenomic sequencing on the Illumina Novaseq 6000 platform. Bioinformatics  
102 analyses were performed on the Earlham Institute's High Performance Computing cluster and on  
103 the Cloud Infrastructure for Microbial Bioinformatics (Connor et al., 2016). Sequences were  
104 assessed for quality using FastQC Version 0.11.8 and trimmed using Trimmomatic Version 0.36,  
105 configured to a minimum read length of 40, "leading" and "trailing" settings of 3  
106 (SLIDINGWINDOW:4:20) (Andrews, ; Bolger et al., 2014). Metagenomic sequences for all  
107 samples have been uploaded to the Sequence Read Archive under Bioproject ID PRJNA543206.  
108

### 109 **Reference-based metagenomic analysis**

110 An initial analysis of our chicken faecal sequences using the Kraken 2 taxonomic classifier  
111 (Wood et al., 2019) was performed on custom databases representing the domestic chicken  
112 genome (GenBank assembly accession GCF\_000002315.6) and the food plants *Triticum*  
113 *aestivum* (wheat), *Aegilops tauschii* (diploid progenitor of the D genome of hexaploid wheat) and  
114 *Glycine max* (soy bean): GenBank assembly accessions GCF\_001957025.1, GCA\_900519105.1,  
115 GCA\_000004515.4. Kraken 2 revealed that 8% ( $\pm 16\%$ ) of reads originated from the chicken and  
116 at least 19% ( $\pm 21\%$ ) originated from the diet. These sequences were filtered from our dataset and  
117 excluded from subsequent analyses by keeping only reads 'Unclassified' by Kraken 2 after  
118 comparison with each database in turn.

119 The remaining dataset underwent taxonomic profiling using Kraken 2 against a microbial  
120 database built from all complete/representative archaeal, bacterial, fungal, protozoan, viral and  
121 UniVec\_Core sequences in RefSeq (O'Leary et al., 2016) in January 2020. Bracken (Lu et al.,  
122 2017) was used to estimate taxon abundance from the Kraken 2 profiles, accepting only those  
123 taxa with  $\geq 1000$  assigned reads. Bracken-database files were generated using "bracken-build" on  
124 our microbial database and visualised using KronaTools (Ondov et al., 2011).  
125

### 126 **Metagenomic assembly**

127 We searched the NCBI BioProjects database (<https://www.ncbi.nlm.nih.gov/bioproject/>) in  
128 November 2019 with the term "chicken gut microbiome" and then selected nine publicly  
129 available projects that contained at least one metagenomic sequence dataset >1GByte in size:  
130 PRJEB33338, PRJNA193217, PRJNA291299, PRJNA375762, PRJNA415593, PRJNA417359,  
131 PRJEB22062, PRJNA543206, PRJNA417359, PRJNA385038, PRJNA616250. Only four of  
132 these studies were linked to research publications at the time of publication (Glendinning et al.,  
133 2020; Sergeant et al., 2014; Foster-Nyarko et al., 2020; Luiken et al., 2020)

134 All shotgun metagenomic reads were quality-filtered by removing reads shorter than 70% of  
135 the maximum expected read length (100 bp, 250 bp for MiSeq data), an estimated accumulated  
136 error >2.5 with a probability of  $\geq 0.01$  (Puente-Sánchez et al., 2016) or with an observed  
137 accumulated error >2, or >1 ambiguous position to assist assembly. If base quality dropped  
138 below 20 in a window of 15 bases at the 3' end, or if the accumulated error exceeded 2, reads

139 were trimmed. All these filter steps are integrated in sdm (Hildebrand et al., 2014). Reads  
140 mapping to the chicken genome and diet were removed from the metagenomic data as described  
141 previously, classifying reads with Kraken 2 against custom databases built on the  
142 aforementioned genomes.

143 Sequence datasets from our fifty samples—together with 582 samples from the selected  
144 BioProjects—were assembled using MegaHIT (Li et al., 2016) under the option “--k-list  
145 25,43,67,87,101,127”. To avoid artefacts that sometimes result from co-assembly of sequences  
146 from different samples and different sources, we performed individual assemblies on each  
147 sample, with the exception of BioProject PRJNA17359. For that BioProject, as multiple  
148 metagenomic samples had been sourced from different tissues of the same individual bird, we  
149 co-assembled reads from the 120 BioSamples from that project.

150

### 151 **Bacteriophage identification and characterisation**

152 Scaffold sequences from the MegaHIT assemblies of our fifty samples that were  $\geq 10$ kb were  
153 analysed with VirSorter v1.0.5 with the “-db 2” option to identify viral genomes (Roux et al.,  
154 2015). VirSorter Category 1 and 2 scaffold sequences were collapsed at 95% nucleotide identity  
155 over 70% of the sequence length using CD-Hit Est v4.6.1 (Fu et al., 2012). Classification of  
156 bacteriophage sequences relied on nucleotide searches using BLASTN against the NCBI NT  
157 database (Completed April 2020) and protein searches using Kaiju Version 1.7.3 against the  
158 RefSeq database (Completed April 2020) (Menzel et al., 2016). Only bacteriophage genomes  
159 with BLASTN hit E-Value  $< 0.05$ , percentage identity  $> 70\%$  and query covering  $> 50\%$  were  
160 selected as reliable hits.

161 A taxonomic assignment was drawn from the highest scoring BLASTN (or in rare cases  
162 BLASTP) hit ranked by query cover and percentage ID. Synteny between predicted coliphages  
163 and their respective reference genomes were visualised using EasyFig (Sullivan et al., 2011).  
164 *Escherichia* bacteriophage coverage per sample was determined using Anvi'o v6.1 (Eren et al.,  
165 2015) using default parameters and visualised in R using the Pheatmap package  
166 (<https://www.rdocumentation.org/packages/pheatmap>). Remaining viral genomes were filtered  
167 for completeness, retaining those that were circular and encoded a complete terminase gene (as  
168 predicted by VirSorter). Taxonomic assignments to family were performed on viral genomes  
169 using Demovir (<https://github.com/feargalr/Demovir>).

170

### 171 **Gene catalogue**

172 Complete genes identified by Prodigal v2.6.1 (Hyatt et al., 2010) were clustered at 95%  
173 nucleotide identity using CD-HIT-Est v4.6.1 (Fu et al., 2012). Incomplete genes were then  
174 mapped to this complete gene list using Bowtie2 v 2.3.4.1 (Langmead & Salzberg, 2012) and  
175 any mapping at 95% nucleotide identity were incorporated into the relevant gene clusters.  
176 Finally, genes representing the forty conserved marker genes defined by Mende *et al* (Mende et  
177 al., 2013) were clustered separately and then merged with the existing set of gene clusters. We  
178 thus obtained a gene catalogue of  $> 20$  million genes, defined as non-redundant at 95% average  
179 nucleotide identity. The final gene catalogue was uploaded to FigShare  
180 (<https://doi.org/10.6084/m9.figshare.13116809.v1>)

181

### 182 **Abundance estimates of contigs and genes**

183 Prodigal (Hyatt et al., 2010) was applied in metagenome-mode to all contigs from the MegaHIT  
184 assemblies. Unfiltered reads from each sample were mapped against their respective assembly to

185 provide an estimate of contig and gene abundance using Bowtie2 (Langmead & Salzberg, 2012)  
186 with the options “--no-unal--end-to-end -score-min L, -0.6,-0.6”. Samtools 1.3.1 was used to sort  
187 and index all resulting Bam files (Li et al., 2009). Only reads with mapping quality >20, >95%  
188 nucleotide identity and >75% overall alignment length were retained. BEDTools v2.21.0  
189 (Quinlan, 2014) was used to create depth profiles from the Bam files. These depth profiles were  
190 then translated with rdCover (<https://github.com/hildebra/rdCover>) into average coverage (in a  
191 50 bp window) per contig or per gene predicted from each contig. Bam files were translated to  
192 abundances using the “jgi\_summarize\_bam\_contig\_depths” script from the MetaBAT 2 package  
193 (Kang et al., 2019).

194 Gene abundances were linked to their respective gene clusters and originating samples.  
195 Redundant genes representing the same orthologue were removed.

196

### 197 **Binning**

198 We identified metagenomic species (MGSs) using the combinatorial approach described by  
199 Hildebrand *et al* (Hildebrand et al., 2019), incorporating single-assembly binning in the creation  
200 of metagenome-assembled genomes (MAGs), gene catalogue binning in the creation of canopy  
201 clusters (Nielsen et al., 2014) and hierarchical clustering of candidate genes using the R function  
202 hclust, method = complete. To start with, we used MetaBAT 2 v2.15 (Kang et al., 2019) to bin  
203 contigs  $\geq 400$ bp. These were quality filtered using CheckM v1.0.11 (Parks et al., 2015) to obtain  
204 5,695 bins at >80% completeness and <5% contamination.

205 Species-level clusters were formed using a combination of two distinct approaches. One  
206 approach removed redundancy between samples by pre-clustering bins if  $\geq 30\%$  of their genes  
207 overlapped with a higher-quality bin to create a set of pre-MGS bins. Lower-quality bins (>60%  
208 completeness and <10% contamination) were also included in the analysis but were not used to  
209 form new species clusters. To recover prokaryotic species usually obscured using single-sample  
210 assemblies and conventional binning techniques, we refined all species bins into “hcl-clusters”  
211 using gene correlations and hierarchical clustering, as described by Hildebrand *et al* (Hildebrand  
212 et al., 2019). We chose genes occurring in  $\geq 10\%$  of all associated MAGs as representatives for  
213 each pre-MGS bin and used these to fish for additional co-occurring genes from the gene  
214 catalogue, using a threshold of >0.75 Pearson correlation and >0.85 spearman rho to identify  
215 gene co-occurrences within this core gene set. We then merged MetaBAT 2 bins, canopy bins  
216 and co-occurring genes into our species bins. We used the presence of 40 known single-copy  
217 marker genes, without duplicates, as a quality criterion in selection of sub-clusters, before  
218 extracting the final set of MGS gene representatives using MATAFILER  
219 (<https://github.com/hildebra/MATAFILER>). The final collection of MGS bins (canopy clusters +  
220 hcl-clusters) was re-assessed for contamination and completeness using CheckM (Parks et al.,  
221 2015), so that we could be confident that each bin represents a single species.

222 A second approach de-replicated all MAGs at 95% average nucleotide identity (ANI)  
223 (species-level) and 99% ANI (strain-level) using dRep Version 2.0 (Olm et al., 2017) and only  
224 species not identified in approach one were added to the resulting non-redundant species  
225 catalogue. The minimum aligned fraction used during ANI genome alignment was 60%. A single  
226 representative MAG for each novel species cluster was uploaded to NCBI SRA under BioProject  
227 PRJNA543206 and all MAGs generated were uploaded to FigShare  
228 (<https://doi.org/10.6084/m9.figshare.13116809.v1>). CompareM Version 0.1.1  
229 (<https://github.com/dparks1134/CompareM>) was used to calculate average amino acid identity

230 between novel genera. The minimum sequence coverage for reporting an AAI alignment was set  
231 to default at 70%.

232

233

### 234 **Taxonomy of metagenomic species**

235 We used the Genome Taxonomy Database Toolkit (GTDB-Tk Release 95) to perform taxonomic  
236 assignments on strain-level dereplicated MAGs (Chaumeil et al., 2019). In addition, genes from  
237 each MGS were analysed through GTDB-Tk (Release 95), proGenomes resource (Mende et al.,  
238 2017) and underwent k-mer-based taxonomic profiling using Kraken 2. In assigning taxonomy,  
239 we allowed GTDB assignments to take precedence—only when no GTDB taxonomy was  
240 available would we adopt taxonomies assigned by ProGenomes and Kraken 2 and, then, only  
241 where genus and family assignments from these sources matched. When exploiting the  
242 taxonomy assigned according genes from metagenomic species, we applied a least-common-  
243 ancestor approach to unplaced taxa at higher taxonomic levels. Species distribution analyses  
244 were conducted using the Vegan package in R (R-Core-Team., 2018), before visualisation using  
245 ggplot2 (Wickham, 2016) and Pheatmap R packages  
246 (<https://www.rdocumentation.org/packages/pheatmap>). Pan-genome analysis was conducted  
247 using Roary v3.11.2 and visualised using the roary2svg.pl script (Page et al., 2015). Comparison  
248 of our derived metagenomes with those of Glendinning et al. (Glendinning et al., 2020) was  
249 performed at 95% ANI using dRep and visualised using web-tool BioVenn (Hulsen et al., 2008).

250

### 251 **Bacterial culture**

252 To estimate species richness and diversity, the Phyloseq package of R (R-Core-Team., 2018) was  
253 applied to the output from Bracken (Lu et al., 2017) on all of our chicken faecal metagenomic  
254 datasets. The six faecal samples that showed highest species richness and taxonomic diversity  
255 were selected for culture-based studies. Frozen faecal samples were thawed, vortexed and two  
256 0.5g aliquots (once processed aerobically, the other anaerobically) from each sample were  
257 suspended in 5ml PBS. Each aliquot was vortexed until homogenised, before performing serial  
258 dilutions in duplicate down to  $1 \times 10^{-5}$ . Processing of samples for aerobic and anaerobic culture  
259 was identical, except that, for anaerobic culture, all culture media, diluent and consumables were  
260 pre-reduced to anaerobic conditions for at least 24 hours before faecal samples were processed in  
261 a Whitley A95TG workstation.

262 For dilutions  $10^{-3} - 10^{-5}$ , 200 $\mu$ l was plated directly on to a set of three agar plates for each  
263 culture medium (Brain Heart Infusion, Colombia Blood Agar, Yeast extract, casitone and fatty  
264 acid) with or without vancomycin supplementation at a concentration of 6 $\mu$ g/ml (Table S1).  
265 Cultures were incubated at 37°C for 72 hours in their respective conditions before assessment of  
266 colony growth. Well-isolated colonies were picked according to colonial morphotype distinctive  
267 in colour, shape and size, before being re-streaked on to the growth medium from which they  
268 were sourced to confirm purity. Individual colonies were subsequently used to inoculate 2ml of  
269 broth based on the source culture medium, incubated at 37°C for a further 24 hours before  
270 bacterial DNA extraction. All isolates were archived at -80°C in glycerol at 20% concentration.

271

### 272 **Genome sequencing and analysis**

273 Genomic DNA was extracted using a DNeasy UltraClean DNA isolation kit according to the  
274 manufacturer's instructions (Qiagen, Hilden, Germany). DNA was quantified using a Qubit®  
275 fluorometer (Invitrogen, CA, USA) high-sensitivity assay, before dilution to the required

276 concentration in RNase-free water and purification on AMPure XP beads (Beckman Coulter).  
277 Sequencing libraries were prepared from 0.5ng/μl of RNA free genomic DNA. A total of 282  
278 isolates were included for genomic sequencing using the Nextera-XT DNA sample preparation  
279 kit (Illumina) and whole-genome sequencing performed using the Illumina NextSeq sequencing  
280 platform, generating paired-end reads (2 x 150bp).

281 Paired-end reads were quality-assessed and trimmed using FastQC and Trimmomatic as  
282 described above. Trimmed reads were assembled into scaffolds using SPAdes version 3.13.1  
283 (Bankevich et al., 2012). Scaffolds shorter than 500 bp were discarded from analysis. Genome  
284 contamination and completeness was assessed using CheckM version 1.0.13. To confirm  
285 assembly quality, only genomes conforming to all the following criteria were included in further  
286 analysis: (i) scaffold N50 of >20 kbp (ii) 90% of assembled bases at > 5x read coverage (iii)  
287 completeness of > 95% (iv) contamination of < 5% (v) complete 16S rRNA gene sequence.

### 288 **Genome sequence taxonomic assignment**

289 Barrnap Version 0.9 (<https://github.com/tseemann/barrnap>) was applied to all genomes that  
290 passed the quality filters to extract full-length 16S rRNA gene sequences. These were then  
291 compared to NCBI 16S rRNA gene sequences from RefSeq genomes using the NCBI's web-  
292 based BLASTN facility (Altschul et al., 1990). 16S rRNA gene sequences that showed an  
293 identity of <98.7% to known sequences were assigned to novel species, using the conservative  
294 approach in proposed minimal standards (Chun et al., 2018). We used ReferenceSeeker Version  
295 1.6.2 (Schwengers et al., 2019) to determine average nucleotide identity (ANI) and conserved  
296 DNA values compared to RefSeq bacterial genomes (Completed March 2020) (O'Leary et al.,  
297 2016). Genomes that showed ANI ≤95% and conserved DNA ≤69% to the closest relative were  
298 designated novel species. The Genome Taxonomy Database Toolkit (GTDB-Tk Release 89) was  
299 used to perform taxonomic assignments on isolate genomes (Chaumeil et al., 2019). Genomes  
300 were clustered at 95% and 99% ANI before selection of a single representative isolate per  
301 species using dRep (Olm et al., 2017). Where a genome previously designated as novel clustered  
302 with a genome of assigned taxonomy, this taxonomy was then applied to the previously  
303 designated 'novel' genome. Final taxonomic assignments were based on genome-based ANI  
304 values derived from RefSeq and GTDB – with GTDB assignments taking precedence. A single  
305 representative genome for each novel or renamed species cluster was uploaded to NCBI SRA  
306 under BioProject PRJNA543206 and all genomes alongside respective 16S rRNA gene  
307 sequences generated were uploaded to FigShare (<https://doi.org/10.6084/m9.figshare.13234556>).

### 309 **Phylogenetic analysis**

310 For phylogenetic analysis of all MGS and genome sequenced isolates we used PhyloPhlAn  
311 v3.0.58 (Asnicar et al., 2020) with the “diversity high” and a proteome input predicted from all  
312 genome sequences using Prodigal v2.6.1 (Hyatt et al., 2010). Diamond v0.9.34 (Buchfink et al.,  
313 2015) was used to perform a search against 400 universal PhyloPhlAn markers. MAFFT v.7.271  
314 (Kato et al., 2002) was used to perform multiple sequence alignment before refinement with  
315 trimAl v.1.4 (Capella-Gutiérrez et al., 2009) and reconstruction into trees using FastTree v2.1  
316 and RAxML v. 8.2.12 (Price et al., 2010; Stamatakis, 2014). All trees were visualised using the  
317 online iTOLv1.4 platform for visualisation and manual annotation (Letunic & Bork, 2016). Trees  
318 were scrutinised to confirm that species and genera were monophyletic. Phylogeny for all  
319 cultured genomes unassigned at species level was confirmed as previously described against all  
320 available reference proteomes of that respective genus downloaded from NCBI.  
321

322 To investigate the phylogenetic placement of cultured isolates designated as *Escherichia*  
323 *marmotae* and *Escherichia* sp001660175 by GTDB, we constructed a core genome phylogenetic  
324 tree. The genomes from cultured isolates were compared to genomes representing the full  
325 diversity of the genus *Escherichia*. Three *Salmonella* genomes were included as an outgroup.  
326 The genome sequences were aligned using Mugsy (Angiuoli & Salzberg, 2011), and alignment  
327 blocks conserved across all genomes were concatenated to produce a core genome alignment. A  
328 phylogenetic tree was constructed by maximum likelihood with 100 rapid bootstrap replicates,  
329 using the general time reversible model of nucleotide substitution with gamma correction for rate  
330 heterogeneity, as implemented in RAxML version 8.2.12 (Stamatakis, 2014).

331

## 332 Results

### 333 Reference-based profiling documents novel diversity

334 We collected faecal samples from fifty chickens reared in the UK belonging to two breeds:  
335 Lohman Browns (n=30) and Silkies (n=20). Short-read sequencing of fifty faecal samples  
336 generated a metagenomic dataset in excess of a billion paired-end reads or three hundred billion  
337 base pairs (Table S2).

338 We initially analysed the faecal samples using the k-mer-based program Kraken 2, followed  
339 by refined phylogenetic analysis using the allied program Bracken (Lu et al., 2017) (Table S3).  
340 Unsurprisingly, these programs assigned sequence reads from the faecal samples to all three  
341 domains of life, as well as to viruses (Table S4), although relative abundance assignments show  
342 that bacteria predominate in this environment. Sequences were assigned to a wide range of  
343 bacterial phyla, including the three expected as predominant in the vertebrate gut (Bacteroidetes,  
344 Firmicutes, Proteobacteria), but also including over twenty additional phyla. Searches of the  
345 PubMed database with each phylum name and the term “chicken” reveal that round half of these  
346 have been previously documented in the chicken gut. However, at least a dozen appear to be  
347 novel in this setting, including the *Aquificae*, *Balneolaeota*, *Calditrichaeota*, *Chlorobi*,  
348 *Dictyoglomi*, *Fibrobacteres*, *Gemmatimonadetes*, *Ignavibacteriae*, *Kiritimatiellaeota*,  
349 *Lentisphaerae*, *Nitrospirae*, and the *Thermodesulfobacteria*.

350 When we rank-ordered the species identified by Bracken according to maximum abundance  
351 in any one sample, we found, as expected, that species from the family *Lactobacillaceae*  
352 dominated among the top twenty most abundant organisms. However, we found that two species  
353 of *Escherichia*—*Escherichia coli* and *Escherichia marmotae*—accounted for  $\geq 5\%$  of reads in  
354 nearly half of the samples (23/50) and in two samples, accounted for more than 50%. Such  
355 monodominance of the gut microbiome by bacterial species has been described in diseased  
356 humans (Hildebrand et al., 2019; Ravi et al., 2019), but is surprising in the context of poultry  
357 reported as apparently healthy by their handlers. We also noted a high relative abundance of the  
358 recently described chicken pathogen *Gallibacterium anatis* (Narasinakuppe Krishnegowda et al.,  
359 2020) in most birds (with five birds showing  $>5\%$  reads assigned to this organism), despite their  
360 healthy status. Similarly, *Fusobacterium mortiferum*—an opportunistic pathogen of humans  
361 (Almohaya et al., 2020)—accounted for  $>10\%$  of sequences in ten birds, corroborating a recent  
362 report of high abundance of 16S rRNA gene sequences from this organism obtained from the  
363 chicken caecum (Kollarcikova et al., 2019).

364 Bracken assigned sequences to over a hundred bacteriophage genomes, predominately  
365 phages infecting members of the *Enterobacteriaceae* assigned to the families *Myoviridae* and  
366 *Podoviridae*. Particularly noteworthy was the high abundance of reads in some samples from two  
367 distinct bacteriophages that prey on *E. coli*: phiEcoM-GJ1—a lytic bacteriophage isolated in

368 Canada from pig sewage (Jamalludeen et al., 2008)—which accounted for 6.7% reads in a single  
369 sample and phAPEC8—a lytic bacteriophage with a large 147kb genome, isolated from a  
370 Belgian poultry farm—which accounted for 10% of reads in a single sample and for >1% of  
371 reads in three others (Tsonos et al., 2012).

372 Although these k-mer-based analyses can provide interesting insights into taxonomic  
373 diversity within the chicken gut, we quickly realised that they provide an incomplete and  
374 misleading picture of this important microbiome for several reasons: (1) they often report the  
375 presence of highly implausible organisms—for example, Kraken 2 reported the presence of  
376 human pathogens such as *Shigella flexneri* and *Plasmodium falciparum* that are simply not  
377 credible in this context on clinical grounds; (2) as with studies on 16S rRNA gene sequences,  
378 they fail to provide genomic data or insights into the functional diversity or population structure  
379 of the microbial species that they identify and; (3) they rely on a reference database and so can  
380 only report previously known organisms and can never uncover “unknown unknowns”.

381 The scale of the problem of unknown diversity is clear from the observation that nearly three  
382 quarters (73%) of sequence reads from our chicken samples cannot be confidently classified by  
383 Kraken 2 to species level and more than half of the reads (54%) cannot be classified at all and  
384 are simply designated as “Unassigned”. We therefore sought to extend our understanding of this  
385 community through two powerful reference-free approaches: assembly-based metagenome  
386 analyses and high-throughput culture.

387

### 388 **Metagenomic assembly uncovers a wealth of viral diversity**

389 Assembly of metagenomic sequences is a reference-free approach that involves aligning and  
390 merging short sequence reads into long contiguous sequences (contigs), which can then be  
391 ordered into larger scaffolds that include sequence gaps.

392 To confirm the presence of bacteriophages inferred through the reference-based analysis and  
393 to identify novel viral genomes, we assembled sequence reads from our fifty chicken faecal  
394 samples into scaffolds. Scaffold sequences  $\geq 10$ kb were analysed with VirSorter—a program  
395 designed to detect viral signals in microbial sequence data to find novel viruses (Roux et al.,  
396 2015).

397 VirSorter identified 184 of our chicken faecal scaffolds as Category 1 (“most confident”)  
398 bacteriophage sequences and identified an additional 1,840 scaffolds as Category 2 (“likely”)  
399 bacteriophage sequences. This was de-replicated to 1,455 genomes using similarity thresholds of  
400 95% ANI over 70% of the genome (Table S5). BLASTN analysis revealed only ten of these  
401 bacteriophage genomes showed high similarity (percentage identity > 70%; query covering >  
402 50%) to known phages at the nucleotide level (Table S6). These included close relatives of the  
403 two phages (phiEcoM-GJ1 and phAPEC8) found highly abundant in the Bracken analyses (Fig.  
404 2). Interestingly, more than one genus of coliphage (e.g. *Jilinvirus*, *Phapocotavirus*, or  
405 *Gamaleyavirus*) was often detected in the same sample, along with an abundance of reads from  
406 their predicted prey (*Escherichia*) suggesting interesting dynamics in phage-host and phage-  
407 phage interactions (Fig. 3; Table S7).

408 Of the remaining 1,445 unclassified bacteriophage genomes, nearly 600 encoded either an  
409 obvious terminase region or were circular and as such were suggested as being near-complete.  
410 Classification of these genomes revealed all genomes were predicted to belong to the order  
411 *Caudovirales* of tailed phages, with the majority belonging to the family *Siphoviridae* (n=429),  
412 but we also found representatives from the *Myoviridae* (n=87) and *Podoviridae* (n=27), plus  
413 some bacteriophages unclassified at family level (n=28) (Table S8).

414

**415 Remarkable microbial genome diversity in the chicken gut**

416 Next, we subjected our samples to computational binning—a process of grouping  
417 contigs/scaffolds on the basis of sequence composition and depth of coverage into discrete  
418 population bins representing metagenome-assembled genomes (MAGs). However, to carry out a  
419 definitive survey of bacterial and archaeal diversity in the chicken gut microbiome—in addition  
420 to analysing the fifty faecal samples mentioned and before we started the binning—we retrieved  
421 all publicly available chicken gut metagenomic datasets, to create an expansive dataset  
422 representing >630 samples, drawn from ten studies and twelve countries (Belgium, China,  
423 France, Germany, Italy, Malaysia, Netherlands, Poland, Spain, The Gambia, UK, USA) (Figure  
424 S1a/S1b; Table S9).

425 Sequence assembly and binning on all these samples generated 5,595 MAGs that passed our  
426 quality threshold of  $\geq 80\%$  completion and  $\leq 5\%$  contamination (Figure S1c). Of these 3,131  
427 could be considered high-quality draft genomes, with  $>90\%$  completion and  $<5\%$  contamination,  
428 as judged by recently published criteria (Table S10) (Bowers et al., 2017). Genome sizes of the  
429 MAGs ranged from  $\sim 0.5$  to 6.4 Mbp, while GC content ranged from 24% to 73%.

430 Then, we grouped the MAGs into metagenomic species (MGSs). Initially, this involved de-  
431 replicating MAGs at the widely accepted 95% average nucleotide identity (ANI) for defining  
432 bacterial and archaeal species and 99% ANI for defining bacterial and archaeal strains (Jain et  
433 al., 2018; Luo et al., 2014). De-replication of MAGs at 95% ANI resulted in 846 clusters  
434 representing bacterial and archaeal species, while de-replication at 99% ANI resulted in 2182  
435 clusters, representing strains. However, to improve recovery of MAGs, MGSs and associated  
436 gene sets, we used gene correlations to identify species-representative genes and then applied  
437 hierarchical clustering to co-occurring genes across the samples. This allowed us to identify  
438 additional genes from the core genome of a species, even when they show divergent nucleotide  
439 compositions (such as genes from genomic islands and plasmids) (Hildebrand et al., 2019).  
440 Similarly, using canopy clustering (Nielsen et al., 2014), we could identify commonly occurring  
441 species of low abundance. Using these approaches, we were able to identify an additional seven  
442 MGSs (Table S11). These MGS were prevalent at  $>1x$  coverage in 53% of all analysed samples  
443 spanning at least 4 different BioProjects.

444 Analysis of bacterial metagenomic species, primarily using the Genome Taxonomy Database  
445 (GTDB) taxonomy (Parks et al., 2020), confirmed and extended the taxonomic novelty  
446 uncovered by reference-based community profiling (Fig. 4), recovering species spanning  
447 nineteen of the bacterial phyla defined by GTDB (Table S12). These include *Cyanobacteria* (12  
448 species, 32 strains); *Deferribacterota* (1 species, 1 strain) *Synergistota* (2 species; 5 strains) and  
449 the *Verrucomicrobiota* (7 species; 8 strains).

450 Of the 853 de-replicated bacterial metagenomic species, 321 represented previously  
451 delineated species catalogued in publicly available databases (Table S13). Following direct  
452 comparison, a further 165 metagenomic species had been previously identified by Glendinning *et*  
453 *al* (Glendinning et al., 2020), with these sequences not currently available in public archives.  
454 However, only 158 of our metagenomic species possess validly published names based on Latin  
455 binomials.

456 We performed a search of PubMed with the species name and “chicken”, leaving aside the 33  
457 species named by Glendinning *et al* (Glendinning et al., 2020). This suggested that our study  
458 provides the first-evidence-in-chickens for the majority (81/125) of these species (Table S14).  
459 Examples include: *Jeotgalicoccus halophilus*, first isolated from the traditional fermented

460 seafood, Jeotgal (Yoon et al., 2003) and present in 197 chicken samples; *Aliicoccus persicus*,  
461 first isolated from a hypersaline lake (Amoozegar et al., 2014) and present in 241 chicken  
462 samples; and *Bacteroides reticulotermis*, first isolated from the gut of a termite (Sakamoto &  
463 Ohkuma, 2013) and present in 39 chicken samples.

464 We found that 310 of our metagenomic species could be assigned a taxonomy only at the  
465 level of genus and so represent novel candidate species. A further 56 species could be assigned a  
466 taxonomy only at the level of family and, after AAI clustering at 60%, were assigned to 36 novel  
467 candidate genera. One candidate bacterial species could be assigned a taxonomy only at the level  
468 of order (*Oscillospirales*) and so represent a new family.

469 Three MAGs were assigned to the domain Archaea. One represents the species  
470 *Methanobrevibacter woesei*—which is already known to inhabit the chicken gut (Saengkerdsub  
471 et al., 2007)—while the other two represent novel species within the genera  
472 *Methanocorpusculum* and UBA71.

473

#### 474 **Linnaean binomials for hundreds of new candidate species**

475 Linnaeus first proposed the assignment of Latin binomials to provide a universal nomenclature  
476 for biological species (Linnaeus, 1759). The International Code of Nomenclature of Prokaryotes  
477 (ICNP) sets the rules for naming prokaryotic species (Parker et al., 2019), but currently precludes  
478 the valid publication of names of uncultivated organisms, represented by MAGs or other  
479 sequences. Furthermore, high-throughput generation of MAGs and of sequence-based  
480 taxonomies for bacteria, such as the GTDB (Parks et al., 2020) is often assumed to preclude the  
481 detailed attention usually given to one-by-one construction of Linnaean binomials. As a result,  
482 most uncultured taxa, as well as many taxa defined on sequence-based criteria, have been  
483 assigned unstable, confusing and hard to-remember alphanumeric identifiers.

484 To provide a stable, clear and memorable nomenclature for novel and/or previously unnamed  
485 bacterial and archaeal species from the chicken gut, we exploited the provision within the ICNP  
486 for naming uncultivated taxa via *Candidatus* assignments, which, although provisional, provide  
487 the scientific community with well-formed Latin binomials (Oren, 2017; Oren et al., 2020).  
488 However, this prompted us into an unprecedented effort to create hundreds of new names for the  
489 purpose of this single research study—an effort that required us to devise a scalable  
490 combinatorial system for the creation of binomials. Here, we made extensive combinatorial use  
491 of several dozen Latin and Greek roots pertaining to poultry (*avi-*, *galli-*, *pulli-*, *alektryo*, *ptero*,  
492 *kotto-*, *ornitho-*), intestines (*intestini-* *entero-*), faeces (*faec-*, *kakke*, *merd-*, *kopro-*, *excrement-*)  
493 or microbial life (*-monas*, *-bacterium*, *-microbium*, *-coccus*, *-bacillus*, *-bium*, *-cola*)—twinned  
494 with addition of these roots (singly or in tandem) and/or prefixes (*allo*, *hetero*, *meta-*, *para-*,  
495 *crypto-*) to existing genus names—to create over 150 *Candidatus* genus names. For genera with  
496 alphanumeric designations in GTDB Release 05-RS95 (Parks et al., 2020) known to occur also  
497 in gut microbiomes of other animals, we adopted a similar combinatorial approach, but avoided  
498 roots pertaining to poultry and stuck instead with combinations that simply meant "gut or faecal  
499 microbe", e.g *Fimicola*, *Caccocola*. An additional source of diversity stemmed from repetitive  
500 use of around forty *Candidatus* species epithets built from similar roots, which when combined  
501 with genus names gave us a total of over 650 distinctive binomials for new *Candidatus* species  
502 (Table 1, Table S15).

503

#### 504 **Taxonomic diversity of cultured bacterial isolates**

505 To extend our metagenomics analyses, we applied culture-based methods to six faecal samples  
506 that appeared species-rich in Kraken 2 analyses and in so doing obtained 282 isolates from  
507 aerobic culture (~80% of isolates) and anaerobic culture (~20% of isolates) (Table S16). All  
508 isolates underwent genome sequencing on the Illumina platform and phylogenetic analysis to  
509 enable taxonomic assignment. The resulting chicken gut culture collection was found to contain  
510 56 genera, 93 species and 162 strains drawn from five phyla. These included thirty novel species,  
511 with all novel species confirmed to originate from a monophyletic group through phylogenetic  
512 analysis against all available reference genomes of their respective genus (Figure S2). Curiously,  
513 there was no overlap between the species that we obtained and those reported by Medvecky *et al*  
514 (Medvecky et al., 2018), suggesting that we are far from exhausting the set of species that can be  
515 cultured from this habitat. As with the metagenomic species, all novel or previously unnamed  
516 genera and species from cultured isolates were assigned Linnaean binomials (Table 2; Table  
517 S17). Species-level ANI clustering of all MAGs and all cultured isolates according to phylum is  
518 provided in Figure S4.

519 Interestingly, alongside ten cultured isolates of the well-characterised species *Escherichia*  
520 *coli*, we recovered three isolates from *Escherichia marmotae* (a species recently described in  
521 Himalayan marmots (Liu et al., 2015)). As previously reported, the *E. marmotae* strains cluster  
522 closely with the *Escherichia* Clade V (Liu et al., 2019; Walk, 2015), so all members of this clade  
523 should be considered members of this species (Fig. 5, Table S18). Further analysis of the GTDB  
524 species designated *Escherichia* sp001660175  
525 (<https://gtdb.ecogenomic.org/searches?s=al&q=sp001660175>) confirmed that this species forms  
526 a monophyletic lineage that corresponds to Clade II, among the cryptic environmental clades  
527 described by Whittam and his colleagues (Walk et al., 2009), which was subsequently  
528 documented in birds (Clermont et al., 2011). As Clade II is comparable in divergence to the other  
529 *Escherichia* spp. and cryptic clades, we have therefore assigned the Linnaean binomial  
530 *Escherichia whittamii* to designate a new species (Table 2), honouring the outstanding  
531 contribution of Thomas S. Whittam to the study of *Escherichia* spp. (Walk & Feng, 2011).

532 We found that only sixteen species were common to our cultured isolates and our MGS.  
533 Subsequent sequence mapping allowed us to detect a further two cultured species at  $\geq 1x$   
534 coverage in at least one metagenomic sample (Fig. 6a; Table S19). The genomes from cultured  
535 isolates were on average 20% larger than the corresponding MAG sequences retrieved from the  
536 same source sample (Table S20), which is in line with the completeness threshold of 80% we  
537 adopted in quality assurance of the MAGs. However, when we performed detailed gene content  
538 analyses on three abundant species in both cultured and metagenomic datasets —*Lactobacillus*  
539 *reuteri* (with the synonym *Limosilactobacillus reuteri*), *Escherichia coli* (including the synonym  
540 *Escherichia flexneri*) and *Enterococcus faecium*—we found that >99% of the genes from the  
541 core genomes and nearly half of the genes in the accessory genomes of cultured species were  
542 represented in at least one MAG. These observations suggest that our high-quality MAGs are  
543 sufficiently complete to warrant *Candidatus* names.

544 We analysed our chicken faecal metagenomes with a Kraken 2 database derived from  
545 genomes representing our candidate metagenomic and cultured species, this yielded a  
546 considerable improvement in the number of reads that can be classified through rapid  
547 phylogenetic profiling (Fig. 6b).

548  
549 **Distribution of microbial species**

550 An analysis of the distribution of 820 MGSs across the entire metagenomic dataset revealed  
551 marked variation between samples, with not a single species present at  $\geq 1x$  coverage in all  
552 samples and only 39 species present in  $>90\%$  of samples— although 441 species were present in  
553  $>50\%$  of samples at  $\geq 1x$  coverage (Table S21). At  $\geq 1x$  coverage, co-occurrence of nearly 300  
554 species ( $n=295$ ) was identified across all 10 BioProjects (Fig. 7a), with no species identified in  
555 all BioProjects at  $\geq 10x$  coverage (Fig. 7b). Focusing on samples from distinct sites, we found no  
556 species present in all faecal samples at  $>1x$  coverage and only two species were found in all  
557 caecal samples at  $>1x$  coverage: both of them newly named in this study: *Paraprevotella*  
558 *stercoravium* and *Blautia pullistercoris* (the latter identified but not named by Glendinning et al.  
559 2020 (Glendinning et al., 2020). These findings rule out the concept of a core chicken gut  
560 microbiome. Studies on the human gut microbiome provide a useful comparison in that, in a  
561 recent study, only fourteen genera were found to be shared across 95% of samples from the  
562 human gut (Falony et al., 2016).

563 Among the species with high coverage, frequency is clearly linked to Bioproject. Although  
564 species quantification curves showed that the number of species identified increased rapidly with  
565 the number of samples, species discovery appeared to plateau at approximately 230 species after  
566 including only 50 metagenomes (Figure S2a). Only two species appeared to be restricted (at  $\geq 1x$   
567 coverage) to just a single sample: *Aliarcobacter thereius* and *Candidatus Avibacteroides*  
568 *faecavium*. Correlation clustering confirmed structure in the data linked to BioProject (Figure  
569 S2b) —for example, the BioProject from the study by Glendinning *et al* (Glendinning et al.,  
570 2020) clearly shows enhancement of clostridial species compared to other BioProjects, which  
571 reflects the fact that samples in that study were sourced from chicks with no post-hatching  
572 contact with an adult bird. However, the BioSamples do not appear to cluster by country (Figure  
573 S2c) and show only limited clustering by sample site (Figure S2d). Unfortunately, there is  
574 insufficient metadata for other potentially important factors, such as breed, age or diet to draw  
575 conclusions on how these might influence clustering.

576

## 577 Discussion

578 Given the dominance of chickens in the planetary biomass, the chicken gut microbiome ranks as  
579 one of the most abundant microbial communities on the planet. Here, we have exploited two  
580 complementary approaches—metagenomics and culture—to create an extensive catalogue of  
581 genes, genomes and isolates from this important ecosystem. Our work illustrates the value of  
582 combining culture-dependent and culture-independent approaches in analysing microbiomes.

583 We have clearly demonstrated the advantages of shotgun metagenomic sequencing, when  
584 applied to the chicken gut microbiome, providing catalogues of genes and genome sequences  
585 that takes us well beyond what can be achieved using 16S ribosomal RNA gene sequences.  
586 Similarly, the current study is much wider in scope than the previous study by Glendinning and  
587 colleagues (Glendinning et al., 2020), not just including analyses of viral genomes and cultured  
588 isolates, while also incorporating MAGs built from data not just from that study but from all  
589 publicly available metagenomic datasets. Furthermore, the limited overlap between bacterial  
590 species represented among our cultured isolates and in our MGS reinforces the utility of the  
591 combined approach. Nonetheless, the substantial co-linearity between genomes obtained by the  
592 two approaches—and with those from another similar metagenomic study (Glendinning et al.,  
593 2020)—confirms the reliability of our binning approaches.

594 We were surprised to find such a remarkable phylogenetic diversity within this commonplace  
595 livestock ecosystem—diversity that rivals that associated with the human gut. Our work has

596 more than doubled the number of bacterial species known to reside in the chicken gut and has  
597 resulted in the creation of an unprecedented number of new *Candidatus* species. By including  
598 well-formed Latin binomials with the genomes we have uploaded into public repositories, we  
599 have ensured that the new proposed names and associated sequences will be integrated into  
600 commonly used online taxonomies and databases and will provide a stable taxonomic  
601 nomenclature for future studies. In addition, we have provided proof-of-principle for a scalable  
602 approach to Linnaean nomenclature that could be applied to species recovered from other  
603 metagenomic assembly projects.

604 Given that we did not recover by culture some of the organisms that appear most abundant by  
605 metagenomics, there is clearly scope for additional culture-based investigations, using a wider  
606 range of cultural conditions—perhaps drawing on the precedent of the Human Microbiome  
607 Project to create and target a list of the “most-wanted-for-culture” organisms documented by  
608 metagenomics (Fodor et al., 2012). The fact that novel metagenomic species are still being  
609 recovered from human gut datasets that include tens of thousands of metagenomes (Almeida et  
610 al., 2019)—twinned with the promise of novel long-read and proximity-capture approaches to  
611 metagenome analyses (Stewart et al., 2018)—make it clear that our attempts here to analyse all  
612 currently available chicken gut metagenomes provide far from the last word on microbial  
613 diversity in this abundant and important ecosystem. Nonetheless, the availability of so many  
614 novel genes, genome and species represents a substantial step forward.

615

## 616 **Conclusions**

617 The extensive catalogue of genes, genomes and isolates we have created here substantially  
618 improves the coverage of the chicken gut microbiome in the public databases and will make it  
619 possible to profile sequences from the chicken gut much more rapidly, easily and  
620 comprehensively, providing a valuable resource that lays the ground-work for future comparative  
621 and intervention studies. This study also sets a provocative precedent—relevant not just to  
622 animal microbiomes, but to studies on all microbiomes—assigning well-formed Latin binomials  
623 to hundreds of metagenomic species in a scalable alternative to the automated use of bland,  
624 unstable, user-unfriendly alphanumeric designations. Drawing on the precedent set by the  
625 current study, we have recently extended this approach to encompass creation of more than a  
626 million new names for Bacteria and Archaea (Pallen et al., 2020). Thus, the time is now ripe to  
627 bring Linnaeus right into the heart of microbiome studies.

628

## 629 **Acknowledgements**

630 The authors thank the farmers for collecting the chicken faecal samples for the study.

**Description of *Candidatus Acetatifactor stercoripullorum* sp. nov.**

*Candidatus Acetatifactor stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID CHK195-6426 and which is available via NCBI BioSample SAMN15816622. The GC content of the type genome is 48.46% and the genome length is 3.1 Mbp.

**Description of *Candidatus Acinetobacter avistercoris* sp. nov.**

*Candidatus Acinetobacter avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung; N.L. gen. n. *avistercoris* of bird faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID 5402 and which is available via NCBI BioSample SAMN15816735. The GC content of the type genome is 38.29% and the genome length is 3.9 Mbp.

**Description of *Candidatus Acutalibacter ornithocaccae* sp. nov.**

*Candidatus Acutalibacter ornithocaccae* (or.ni.tho.cac'cae. Gr. masc. or fem. n. *ornis*, *ornithos* bird Gr. fem. n. *kakke* faeces; N.L. gen. n. *ornithocaccae* of bird faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiBcolR8-3208 and which is available via NCBI BioSample SAMN15816822. This is a new name for the alphanumeric GTDB species sp000435395. The GC content of the type genome is 62.02% and the genome length is 2.1 Mbp.

**Description of *Candidatus Acutalibacter pullicola* sp. nov.**

*Candidatus Acutalibacter pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID CHK185-1770 and which is available via NCBI BioSample SAMN15816590. The GC content of the type genome is 58.43% and the genome length is 2.1 Mbp.

**Description of *Candidatus Acutalibacter pullistercoris* sp. nov.**

47 *Candidatus Acutalibacter pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
48 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

49

50 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
51 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
52 assigned the MAG ID 1282 and which is available via NCBI BioSample SAMN15816718. The  
53 GC content of the type genome is 63.65% and the genome length is 2.0 Mbp.

54

55

56 **Description of *Candidatus Acutalibacter stercoravium* sp. nov.**

57 *Candidatus Acutalibacter stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
58 bird; N.L. gen. n. *stercoravium* of bird faeces)

59

60 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
61 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
62 assigned the MAG ID ChiBcolR1-495 and which is available via NCBI BioSample  
63 SAMN15816868. This is a new name for the alphanumeric GTDB species sp900543555. The  
64 GC content of the type genome is 60.31% and the genome length is 2.0 Mbp.

65

66

67 **Description of *Candidatus Acutalibacter stercorigallinarum* sp. nov.**

68 *Candidatus Acutalibacter stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
69 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

70

71 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
72 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
73 assigned the MAG ID ChiGjej2B2-2649 and which is available via NCBI BioSample  
74 SAMN15816629. The GC content of the type genome is 63.77% and the genome length is 2.1  
75 Mbp.

76

77

78 **Description of *Candidatus Agathobaculum intestinigallinarum* sp. nov.**

79 *Candidatus Agathobaculum intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
80 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

81

82 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
83 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
84 assigned the MAG ID ChiGjej6B6-20540 and which is available via NCBI BioSample  
85 SAMN15816816. This is a new name for the alphanumeric GTDB species sp900555465. The  
86 GC content of the type genome is 60.79% and the genome length is 2.0 Mbp.

87

88

89 **Description of *Candidatus Agathobaculum intestinipullorum* sp. nov.**

90 *Candidatus Agathobaculum intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut;  
91 L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

92

93 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
94 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
95 assigned the MAG ID ChiBcec16-9926 and which is available via NCBI BioSample  
96 SAMN15816670. The GC content of the type genome is 57.76% and the genome length is 1.9  
97 Mbp.

98  
99

100 **Description of *Candidatus Agathobaculum merdavium* sp. nov.**

101 *Candidatus Agathobaculum merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
102 bird; N.L. gen. n. *merdavium* of bird faeces)

103

104 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
105 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
106 assigned the MAG ID ChiBcec15-6302 and which is available via NCBI BioSample  
107 SAMN15816712. The GC content of the type genome is 57.98% and the genome length is 2.0  
108 Mbp.

109  
110

111 **Description of *Candidatus Agathobaculum merdigallarum* sp. nov.**

112 *Candidatus Agathobaculum merdigallarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
113 fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

114

115 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
116 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
117 assigned the MAG ID ChiSjej1B19-3834 and which is available via NCBI BioSample  
118 SAMN15816715. The GC content of the type genome is 57.98% and the genome length is 2.0  
119 Mbp.

120  
121

122 **Description of *Candidatus Agathobaculum merdipullorum* sp. nov.**

123 *Candidatus Agathobaculum merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc.  
124 n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

125

126 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
127 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
128 assigned the MAG ID CHK149-1869 and which is available via NCBI BioSample  
129 SAMN15816722. The GC content of the type genome is 56.28% and the genome length is 1.7  
130 Mbp.

131  
132

133 **Description of *Candidatus Agathobaculum pullicola* sp. nov.**

134 *Candidatus Agathobaculum pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
135 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

136

137 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
138 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

139 assigned the MAG ID 2940 and which is available via NCBI BioSample SAMN15816725. The  
140 GC content of the type genome is 54.80% and the genome length is 2.0 Mbp.

141

142

143 **Description of *Candidatus Agathobaculum pullistercoris* sp. nov.**

144 *Candidatus Agathobaculum pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken;  
145 L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

146

147 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
148 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
149 assigned the MAG ID CHK180-9785 and which is available via NCBI BioSample  
150 SAMN15816619. The GC content of the type genome is 58.01% and the genome length is 2.3  
151 Mbp.

152

153

154 **Description of *Candidatus Agathobaculum stercoravium* sp. nov.**

155 *Candidatus Agathobaculum stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
156 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

157

158 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
159 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
160 assigned the MAG ID ChiW21-6059 and which is available via NCBI BioSample  
161 SAMN15816625. The GC content of the type genome is 59.83% and the genome length is 2.3  
162 Mbp.

163

164

165 **Description of *Candidatus Agrococcus pullicola* sp. nov.**

166 *Candidatus Agrococcus pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
167 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

168

169 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
170 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
171 assigned the MAG ID ChiGjej1B1-98 and which is available via NCBI BioSample  
172 SAMN15816710. The GC content of the type genome is 63.86% and the genome length is 3.0  
173 Mbp.

174

175

176 **Description of *Candidatus Akkermansia intestinavium* sp. nov.**

177 *Candidatus Akkermansia intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
178 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

179

180 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
181 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
182 assigned the MAG ID ChiGjej6B6-8097 and which is available via NCBI BioSample  
183 SAMN15816856. This is a new name for the alphanumeric GTDB species sp900548895. The  
184 GC content of the type genome is 65.09% and the genome length is 2.2 Mbp.

185

186

**187 Description of *Candidatus Akkermansia intestinigallinarum* sp. nov.**188 *Candidatus Akkermansia intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;189 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

190

191 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
192 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
193 assigned the MAG ID 14975 and which is available via NCBI BioSample SAMN15816742. The  
194 GC content of the type genome is 63.40% and the genome length is 2.1 Mbp.

195

196

**197 Description of *Candidatus Alectryobacillus* gen. nov.**198 *Candidatus Alectryobacillus* (A.lec.try.o.ba.cil'lus. Gr. neut. n. *alektryon* chicken; L. masc. n.199 *bacillus* a rod; N.L. masc. n. *Alectryobacillus* a bacillus found in poultry)

200

201 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
202 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
203 species *Alectryobacillus merdavium*. This genus has been assigned by GTDB-Tk v1.3.0 working  
204 on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFN20* and to  
205 the family *CAG-826*.

206

207

**208 Description of *Candidatus Alectryobacillus merdavium* sp. nov.**209 *Candidatus Alectryobacillus merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*210 bird; N.L. gen. n. *merdavium* of bird faeces)

211

212 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
213 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
214 assigned the MAG ID 13038 and which is available via NCBI BioSample SAMN15816966. The  
215 GC content of the type genome is 27.10% and the genome length is 1.2 Mbp.

216

217

**218 Description of *Candidatus Alectryocaccobium* gen. nov.**219 *Candidatus Alectryocaccobium* (A.lec.try.o.cac.co'bi.um. Gr. neut. n. *alektryon* chicken; Gr.220 fem. n. *kakke* faeces; Gr. masc. n. *bios* life; N.L. neut. n. *Alectryocaccobium* A life form found in  
221 chicken faeces)

222

223 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
224 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
225 species *Alectryocaccobium stercorigallinarum*. This genus has been assigned by GTDB-Tk  
226 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
227 order *Lachnospirales* and to the family *Lachnospiraceae*.

228

229

**230 Description of *Candidatus Alectryocaccobium stercorigallinarum* sp. nov.**

231 *Candidatus* Alectryocaccobium stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
232 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

233

234 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
235 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
236 assigned the MAG ID ChiGjej2B2-785 and which is available via NCBI BioSample  
237 SAMN15816998. The GC content of the type genome is 46.32% and the genome length is 1.5  
238 Mbp.

239

240

#### 241 **Description of *Candidatus* Alectryocaccomicrobium gen. nov.**

242 *Candidatus* Alectryocaccomicrobium (A.lec.try.o.cac.co.mi.cro'bi.um. Gr. neut. n. *alektryon*  
243 chicken; Gr. fem. n. *kakke* faeces; N.L. neut. n. *microbium* a microbe; N.L. neut. n.  
244 *Alectryocaccomicrobium* A microbe found in chicken faeces)

245

246 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
247 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
248 species *Alectryocaccomicrobium excrementavium*. This genus has been assigned by GTDB-Tk  
249 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
250 order *Christensenellales* and to the family *CAG-74*.

251

252

#### 253 **Description of *Candidatus* Alectryocaccomicrobium excrementavium sp. nov.**

254 *Candidatus* Alectryocaccomicrobium excrementavium (ex.cre.ment.a'vi.um. L. neut. n.  
255 *excrementum* excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

256

257 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
258 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
259 assigned the MAG ID 13766 and which is available via NCBI BioSample SAMN15816965. The  
260 GC content of the type genome is 59.90% and the genome length is 3.0 Mbp.

261

262

#### 263 **Description of *Candidatus* Alistipes avicola sp. nov.**

264 *Candidatus* Alistipes avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
265 *avicola* inhabitant of birds)

266

267 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
268 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
269 assigned the MAG ID CHK169-11906 and which is available via NCBI BioSample  
270 SAMN15816659. The GC content of the type genome is 53.79% and the genome length is 1.6  
271 Mbp.

272

273

#### 274 **Description of *Candidatus* Alistipes avistercoris sp. nov.**

275 *Candidatus* Alistipes avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
276 N.L. gen. n. *avistercoris* of bird faeces)

277

278 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
279 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
280 assigned the MAG ID 653 and which is available via NCBI BioSample SAMN15816855. This is  
281 a new name for the alphanumeric GTDB species sp000434235. The GC content of the type  
282 genome is 62.33% and the genome length is 2.4 Mbp.

283

284

285 **Description of *Candidatus Alistipes cottocaccae* sp. nov.**

286 *Candidatus Alistipes cottocaccae* (cot.to.cac'cae. Gr. masc. n. *kottos* chicken Gr. fem. n. *kakke*  
287 faeces; N.L. gen. n. *cottocaccae* of chicken faeces)

288

289 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
290 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
291 assigned the MAG ID ChiBcec16-1783 and which is available via NCBI BioSample  
292 SAMN15816853. This is a new name for the alphanumeric GTDB species sp002161445. The  
293 GC content of the type genome is 60.94% and the genome length is 2.4 Mbp.

294

295

296 **Description of *Candidatus Alistipes excrementavium* sp. nov.**

297 *Candidatus Alistipes excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum* excrement;  
298 L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

299

300 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
301 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
302 assigned the MAG ID CHK15-232 and which is available via NCBI BioSample  
303 SAMN15816809. This is a new name for the alphanumeric GTDB species sp900021155. The  
304 GC content of the type genome is 61.18% and the genome length is 2.2 Mbp.

305

306

307 **Description of *Candidatus Alistipes excrementigallarum* sp. nov.**

308 *Candidatus Alistipes excrementigallarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n. *excrementum*  
309 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen excrement)

310

311 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
312 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
313 assigned the MAG ID CHK106-249 and which is available via NCBI BioSample  
314 SAMN15816875. The GC content of the type genome is 63.33% and the genome length is 2.3  
315 Mbp.

316

317

318 **Description of *Candidatus Alistipes excrementipullorum* sp. nov.**

319 *Candidatus Alistipes excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
320 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
321 chicken excrement)

322

323 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
324 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
325 assigned the MAG ID ChiHjej8B7-9065 and which is available via NCBI BioSample  
326 SAMN15816799. This is a new name for the alphanumeric GTDB species. The GC content of  
327 the type genome is 56.25% and the genome length is 1.7 Mbp.

328  
329

330 **Description of *Candidatus Alistipes faecavium* sp. nov.**

331 *Candidatus Alistipes faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
332 bird; N.L. gen. n. *faecavium* of bird faeces)

333

334 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
335 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
336 assigned the MAG ID ChiGjej2B2-19477 and which is available via NCBI BioSample  
337 SAMN15816800. The GC content of the type genome is 62.24% and the genome length is 2.3  
338 Mbp.

339

340

341 **Description of *Candidatus Alistipes faecigallinarum* sp. nov.**

342 *Candidatus Alistipes faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
343 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of chicken faeces)

344

345 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
346 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
347 assigned the MAG ID 6451 and which is available via NCBI BioSample SAMN15816915. The  
348 GC content of the type genome is 61.37% and the genome length is 2.2 Mbp.

349

350

351 **Description of *Candidatus Alistipes intestinigallinarum* sp. nov.**

352 *Candidatus Alistipes intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.  
353 fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

354

355 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
356 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
357 assigned the MAG ID 5134 and which is available via NCBI BioSample SAMN15816708. The  
358 GC content of the type genome is 59.58% and the genome length is 2.7 Mbp.

359

360

361 **Description of *Candidatus Alistipes intestinipullorum* sp. nov.**

362 *Candidatus Alistipes intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L. masc.  
363 n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

364

365 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
366 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
367 assigned the MAG ID ChiGjej2B2-5998 and which is available via NCBI BioSample

368 SAMN15816759. The GC content of the type genome is 59.58% and the genome length is 2.3  
369 Mbp.

370

371

372 **Description of *Candidatus Alistipes merdavium* sp. nov.**

373 *Candidatus Alistipes merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
374 N.L. gen. n. *merdavium* of bird faeces)

375

376 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
377 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
378 assigned the MAG ID ChiBcolR5-1230 and which is available via NCBI BioSample  
379 SAMN15816813. This is a new name for the alphanumeric GTDB species sp900544265. The  
380 GC content of the type genome is 63.44% and the genome length is 2.2 Mbp.

381

382

383 **Description of *Candidatus Alistipes merdigallarum* sp. nov.**

384 *Candidatus Alistipes merdigallarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n.  
385 *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

386

387 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
388 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
389 assigned the MAG ID 2432 and which is available via NCBI BioSample SAMN15816893.  
390 Although GTDB has assigned this species to the genus it calls *Alistipes\_A*, this genus  
391 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
392 have used the current validly published name for the genus. The GC content of the type genome  
393 is 49.96% and the genome length is 2.2 Mbp.

394

395

396 **Description of *Candidatus Alistipes merdipullorum* sp. nov.**

397 *Candidatus Alistipes merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
398 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

399

400 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
401 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
402 assigned the MAG ID ChiHjej9B8-3741 and which is available via NCBI BioSample  
403 SAMN15816807. This is a new name for the alphanumeric GTDB species sp900546065. The  
404 GC content of the type genome is 57.66% and the genome length is 2.3 Mbp.

405

406

407 **Description of *Candidatus Alistipes pullicola* sp. nov.**

408 *Candidatus Alistipes pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
409 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

410

411 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
412 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
413 assigned the MAG ID ChiHjej10B9-11434 and which is available via NCBI BioSample

414 SAMN15816929. This is a new name for the alphanumeric GTDB species sp900546005.  
415 Although GTDB has assigned this species to the genus it calls *Alistipes\_A*, this genus  
416 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
417 have used the current validly published name for the genus. The GC content of the type genome  
418 is 52.02% and the genome length is 1.9 Mbp.

419  
420

421 **Description of *Candidatus Alistipes pullistercoris* sp. nov.**

422 *Candidatus Alistipes pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L. neut.  
423 n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

424

425 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
426 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
427 assigned the MAG ID 3244 and which is available via NCBI BioSample SAMN15816930. This  
428 is a new name for the alphanumeric GTDB species sp900240235. Although GTDB has assigned  
429 this species to the genus it calls *Alistipes\_A*, this genus designation cannot be incorporated into  
430 a well-formed binomial, so in naming this species, we have used the current validly published  
431 name for the genus. The GC content of the type genome is 56.88% and the genome length is 2.0  
432 Mbp.

433  
434

435 **Description of *Candidatus Alistipes stercoravium* sp. nov.**

436 *Candidatus Alistipes stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis* bird;  
437 N.L. gen. n. *stercoravium* of bird faeces)

438

439 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
440 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
441 assigned the MAG ID ChiHjej8B7-9257 and which is available via NCBI BioSample  
442 SAMN15816640. The GC content of the type genome is 61.39% and the genome length is 2.0  
443 Mbp.

444  
445

446 **Description of *Candidatus Alistipes stercorigallinarum* sp. nov.**

447 *Candidatus Alistipes stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L. fem.  
448 n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

449

450 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
451 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
452 assigned the MAG ID ChiHcolR4-13572 and which is available via NCBI BioSample  
453 SAMN15816817. This is a new name for the alphanumeric GTDB species sp900542505. The  
454 GC content of the type genome is 62.42% and the genome length is 2.2 Mbp.

455  
456

457 **Description of *Candidatus Alistipes stercoripullorum* sp. nov.**

458 *Candidatus Alistipes stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc. n.  
459 *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

460

461 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
462 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
463 assigned the MAG ID ChiBcec8-6454 and which is available via NCBI BioSample  
464 SAMN15816818. This is a new name for the alphanumeric GTDB species sp006542685. The  
465 GC content of the type genome is 62.87% and the genome length is 2.4 Mbp.

466

467

468 **Description of *Candidatus Anaerobiospirillum merdipullorum* sp. nov.**

469 *Candidatus Anaerobiospirillum merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L.  
470 masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

471

472 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
473 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
474 assigned the MAG ID 687 and which is available via NCBI BioSample SAMN15816911.  
475 Although GTDB has assigned this species to the genus it calls *Anaerobiospirillum\_A*, this genus  
476 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
477 have used the current validly published name for the genus. The GC content of the type genome  
478 is 49.84% and the genome length is 2.0 Mbp.

479

480

481 **Description of *Candidatus Anaerobiospirillum pullicola* sp. nov.**

482 *Candidatus Anaerobiospirillum pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L.  
483 suff. *-cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

484

485 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
486 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
487 assigned the MAG ID 378 and which is available via NCBI BioSample SAMN15816727. The  
488 GC content of the type genome is 52.37% and the genome length is 3.9 Mbp.

489

490

491 **Description of *Candidatus Anaerobiospirillum pullistercoris* sp. nov.**

492 *Candidatus Anaerobiospirillum pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young  
493 chicken; L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

494

495 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
496 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
497 assigned the MAG ID USASDec5-558 and which is available via NCBI BioSample  
498 SAMN15816730. The GC content of the type genome is 49.01% and the genome length is 3.3  
499 Mbp.

500

501

502 **Description of *Candidatus Anaerobiospirillum stercoravium* sp. nov.**

503 *Candidatus Anaerobiospirillum stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem.  
504 n. *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

505

506 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
507 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
508 assigned the MAG ID USASDcec2-551 and which is available via NCBI BioSample  
509 SAMN15816778. The GC content of the type genome is 56.27% and the genome length is 2.9  
510 Mbp.

511  
512

513 **Description of *Candidatus Anaerobutyricum avicola* sp. nov.**

514 *Candidatus Anaerobutyricum avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
515 N.L. n. *avicola* inhabitant of birds)

516

517 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
518 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
519 assigned the MAG ID ChiSxjej6B18-9268 and which is available via NCBI BioSample  
520 SAMN15816760. The GC content of the type genome is 50.20% and the genome length is 2.5  
521 Mbp.

522

523

524 **Description of *Candidatus Anaerobutyricum faecale* sp. nov.**

525 *Candidatus Anaerobutyricum faecale* (fae.ca'le. L. neut. adj. *faecale* of faeces)

526

527 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
528 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
529 assigned the MAG ID CHK182-24705 and which is available via NCBI BioSample  
530 SAMN15816814. This is a new name for the alphanumeric GTDB species sp002161065. The  
531 GC content of the type genome is 48.07% and the genome length is 2.8 Mbp.

532

533

534 **Description of *Candidatus Anaerobutyricum stercoripullorum* sp. nov.**

535 *Candidatus Anaerobutyricum stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
536 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

537

538 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
539 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
540 assigned the MAG ID ChiSxjej3B15-1167 and which is available via NCBI BioSample  
541 SAMN15816729. The GC content of the type genome is 52.36% and the genome length is 2.3  
542 Mbp.

543

544

545 **Description of *Candidatus Anaerobutyricum stercoris* sp. nov.**

546 *Candidatus Anaerobutyricum stercoris* (ster'co.ris. L. gen. n. *stercoris* of dung, excrement)

547

548 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
549 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
550 assigned the MAG ID CHK179-28034 and which is available via NCBI BioSample

551 SAMN15816848. This is a new name for the alphanumeric GTDB species sp900016875. The  
552 GC content of the type genome is 47.36% and the genome length is 3.0 Mbp.

553

554

555 **Description of *Candidatus Anaerofilum excrementigallinarum* sp. nov.**

556 *Candidatus Anaerofilum excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
557 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
558 excrement)

559

560 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
561 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
562 assigned the MAG ID 3951 and which is available via NCBI BioSample SAMN15816720. The  
563 GC content of the type genome is 61.37% and the genome length is 2.5 Mbp.

564

565

566 **Description of *Candidatus Anaerofilum faecale* sp. nov.**

567 *Candidatus Anaerofilum faecale* (fae.ca'le. L. neut. adj. *faecale* of faeces)

568

569 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
570 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
571 assigned the MAG ID ChiGjej6B6-374 and which is available via NCBI BioSample  
572 SAMN15816865. This is a new name for the alphanumeric GTDB species sp002160015. The  
573 GC content of the type genome is 63.11% and the genome length is 2.3 Mbp.

574

575

576 **Description of *Candidatus Anaeromassilibacillus stercoravium* sp. nov.**

577 *Candidatus Anaeromassilibacillus stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L.  
578 fem. n. *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

579

580 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
581 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
582 assigned the MAG ID ChiSjej5B23-4625 and which is available via NCBI BioSample  
583 SAMN15816824. This is a new name for the alphanumeric GTDB species sp002159845. The  
584 GC content of the type genome is 54.17% and the genome length is 2.2 Mbp.

585

586

587 **Description of *Candidatus Anaerostipes avicola* sp. nov.**

588 *Candidatus Anaerostipes avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
589 n. *avicola* inhabitant of birds)

590

591 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
592 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
593 assigned the MAG ID CHK189-27985 and which is available via NCBI BioSample  
594 SAMN15816576. The GC content of the type genome is 43.22% and the genome length is 2.5  
595 Mbp.

596

597

**Description of *Candidatus Anaerostipes avistercoris* sp. nov.**

598 *Candidatus Anaerostipes avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
600 dung; N.L. gen. n. *avistercoris* of bird faeces)

601

602 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
603 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
604 assigned the MAG ID ChiSjej3B21-8574 and which is available via NCBI BioSample  
605 SAMN15816634. The GC content of the type genome is 44.43% and the genome length is 2.6  
606 Mbp.

607

608

**Description of *Candidatus Anaerostipes excrementavium* sp. nov.**

610 *Candidatus Anaerostipes excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
611 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

612

613 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
614 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
615 assigned the MAG ID CHK191-13928 and which is available via NCBI BioSample  
616 SAMN15816615. The GC content of the type genome is 41.56% and the genome length is 2.7  
617 Mbp.

618

619

**Description of *Candidatus Anaerotignum merdipullorum* sp. nov.**

621 *Candidatus Anaerotignum merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc.  
622 n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

623

624 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
625 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
626 assigned the MAG ID CHK190-6203 and which is available via NCBI BioSample  
627 SAMN15816613. The GC content of the type genome is 44.75% and the genome length is 2.2  
628 Mbp.

629

630

**Description of *Candidatus Anaerotruncus excrementipullorum* sp. nov.**

632 *Candidatus Anaerotruncus excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
633 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
634 young chicken excrement)

635

636 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
637 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
638 assigned the MAG ID CHK188-5543 and which is available via NCBI BioSample  
639 SAMN15816616. The GC content of the type genome is 64.05% and the genome length is 1.9  
640 Mbp.

641

642

643 **Description of *Candidatus Aphodenecus* gen. nov.**

644 *Candidatus Aphodenecus* (Aph.o.d.en.e'cus. Gr. fem. n. *aphodos* dung; Gr. masc. *enoikos*  
645 inhabitant; N.L. masc. n. *Aphodenecus* a microbe associated with faeces)

646  
647 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
648 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
649 species *Aphodenecus pullistercoris*. This is a name for the alphanumeric GTDB genus Spiro-01.  
650 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
651 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Sphaerochaetales* and to the family  
652 *Sphaerochaetaceae*.

653

654

655 **Description of *Candidatus Aphodenecus pullistercoris* sp. nov.**

656 *Candidatus Aphodenecus pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
657 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

658

659 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
660 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
661 assigned the MAG ID 11167 and which is available via NCBI BioSample SAMN15817123. The  
662 GC content of the type genome is 59.34% and the genome length is 2.0 Mbp.

663

664

665 **Description of *Candidatus Aphodocola* gen. nov.**

666 *Candidatus Aphodocola* (Aph.o.do'co.la. Gr. fem. n. *aphodos* dung; L. suff. *-cola* inhabitant of;  
667 N.L. fem. n. *Aphodocola* a microbe associated with faeces)

668

669 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
670 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
671 species *Aphodocola excrementigallinarum*. This is a name for the alphanumeric GTDB genus  
672 CAG-594. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
673 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-433*.

674

675

676 **Description of *Candidatus Aphodocola excrementigallinarum* sp. nov.**

677 *Candidatus Aphodocola excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
678 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
679 excrement)

680

681 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
682 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
683 assigned the MAG ID CHK193-30670 and which is available via NCBI BioSample  
684 SAMN15817049. The GC content of the type genome is 27.74% and the genome length is 1.2  
685 Mbp.

686

687

688 **Description of *Candidatus Aphodomonas* gen. nov.**

689 *Candidatus Aphodomonas* (Aph.o.d.omo'nas. Gr. fem. n. *aphodos* dung; L. fem. n. *monas* a  
690 monad; N.L. fem. n. *Aphodomonas* a microbe associated with faeces)

691  
692 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
693 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
694 species *Aphodomonas merdavium*. This is a name for the alphanumeric GTDB genus SFFS01.  
695 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
696 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family *CAG-*  
697 *74*.

698  
699

700 **Description of *Candidatus Aphodomonas merdavium* sp. nov.**

701 *Candidatus Aphodomonas merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
702 bird; N.L. gen. n. *merdavium* of bird faeces)

703

704 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
705 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
706 assigned the MAG ID ChiGjej2B2-35035 and which is available via NCBI BioSample  
707 SAMN15817117. The GC content of the type genome is 59.45% and the genome length is 2.1  
708 Mbp.

709  
710

711 **Description of *Candidatus Aphodomorpha* gen. nov.**

712 *Candidatus Aphodomorpha* (Aph.o.d.o.mor'pha. Gr. fem. n. *aphodos* dung; Gr. fem. n. *morphe* a  
713 form, shape; N.L. fem. n. *Aphodomorpha* a microbe associated with faeces)

714

715 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
716 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
717 species *Aphodomorpha intestinavium*. This is a name for the alphanumeric GTDB genus  
718 UMGS1241. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
719 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
720 *CAG-138*.

721  
722

723 **Description of *Candidatus Aphodomorpha intestinavium* sp. nov.**

724 *Candidatus Aphodomorpha intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem.  
725 n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

726

727 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
728 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
729 assigned the MAG ID ChiGjej2B2-16831 and which is available via NCBI BioSample  
730 SAMN15817204. This is a new name for the alphanumeric GTDB species sp900550525. The  
731 GC content of the type genome is 68.13% and the genome length is 1.6 Mbp.

732  
733

734 **Description of *Candidatus Aphodoplasma* gen. nov.**

735 *Candidatus* Aphodoplasma (Aph.o.d.o.plas'ma. Gr. fem. n. *aphodos* dung; Gr. neut. n. *plasma* a  
736 form; N.L. neut. n. *Aphodoplasma* a microbe associated with faeces)

737

738 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
739 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
740 species *Aphodoplasma excrementigallinarum*. This is a name for the alphanumeric GTDB genus  
741 UMG1253. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
742 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Monoglobales*\_A and to the family  
743 *UMG1253*.

744

745

746 **Description of *Candidatus* Aphodoplasma excrementigallinarum sp. nov.**

747 *Candidatus* Aphodoplasma excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
748 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
749 excrement)

750

751 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
752 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
753 assigned the MAG ID 4920 and which is available via NCBI BioSample SAMN15817155. The  
754 GC content of the type genome is 54.59% and the genome length is 1.8 Mbp.

755

756

757 **Description of *Candidatus* Aphodosoma gen. nov.**

758 *Candidatus* Aphodosoma (Aph.o.d.o.so'ma. Gr. fem. n. *aphodos* dung; Gr. neut. n. *soma* a body;  
759 N.L. neut. n. *Aphodosoma* a microbe associated with faeces)

760

761 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
762 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
763 species *Aphodosoma intestinipullorum*. This is a name for the alphanumeric GTDB genus  
764 SFVR01. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
765 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family  
766 *Paludibacteraceae*.

767

768

769 **Description of *Candidatus* Aphodosoma intestinipullorum sp. nov.**

770 *Candidatus* Aphodosoma intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
771 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

772

773 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
774 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
775 assigned the MAG ID 3924 and which is available via NCBI BioSample SAMN15817132. The  
776 GC content of the type genome is 52.56% and the genome length is 2.4 Mbp.

777

778

779 **Description of *Candidatus* Aphodosia gen. nov.**

780 *Candidatus* Aphodousia (Aph.o.d.ou'si.a. Gr. fem. n. *aphodos* dung; Gr. fem. n. *ousia* an  
781 essence; N.L. fem. n. *Aphodousia* a microbe associated with faeces)

782

783 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
784 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
785 species *Aphodousia faecavium*. This is a name for the alphanumeric GTDB genus CAG-521.  
786 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
787 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Burkholderiales* and to the family  
788 *Burkholderiaceae*.

789

790

791 **Description of *Candidatus* Aphodousia faecalis sp. nov.**

792 *Candidatus* Aphodousia faecalis (fae.ca'lis. L. fem. adj. *faecalis* of faeces)

793

794 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
795 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
796 assigned the MAG ID ChiW13-1064 and which is available via NCBI BioSample  
797 SAMN15817170. This is a new name for the alphanumeric GTDB species sp000437635. The  
798 GC content of the type genome is 47.35% and the genome length is 1.7 Mbp.

799

800

801 **Description of *Candidatus* Aphodousia faecavium sp. nov.**

802 *Candidatus* Aphodousia faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
803 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

804

805 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
806 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
807 assigned the MAG ID 10345 and which is available via NCBI BioSample SAMN15817126. The  
808 GC content of the type genome is 48.23% and the genome length is 1.7 Mbp.

809

810

811 **Description of *Candidatus* Aphodousia faecigallarum sp. nov.**

812 *Candidatus* Aphodousia faecigallarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
813 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

814

815 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
816 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
817 assigned the MAG ID 7463 and which is available via NCBI BioSample SAMN15817137. The  
818 GC content of the type genome is 48.37% and the genome length is 1.5 Mbp.

819

820

821 **Description of *Candidatus* Aphodousia faecipullorum sp. nov.**

822 *Candidatus* Aphodousia faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
823 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

824

825 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
826 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
827 assigned the MAG ID CHK135-12538 and which is available via NCBI BioSample  
828 SAMN15817146. The GC content of the type genome is 48.08% and the genome length is 1.8  
829 Mbp.

830

831

832 **Description of *Candidatus Aphodousia gallistercoris* sp. nov.**

833 *Candidatus* Aphodousia gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
834 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

835

836 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
837 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
838 assigned the MAG ID CHK121-301 and which is available via NCBI BioSample  
839 SAMN15817147. The GC content of the type genome is 52.58% and the genome length is 1.8  
840 Mbp.

841

842

843 **Description of *Candidatus Aphodovivens* gen. nov.**

844 *Candidatus* Aphodovivens (Aph.o.d.o.viv'ens. Gr. fem. n. *aphodos* dung; N.L. pres. part. *vivens*  
845 living; N.L. fem. n. *Aphodovivens* a microbe associated with faeces)

846

847 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
848 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
849 species *Aphodovivens avicola*. This is a name for the alphanumeric GTDB genus UMGS1293.  
850 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
851 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Coriobacteriales* and to the family  
852 *Eggerthellaceae*.

853

854

855 **Description of *Candidatus Aphodovivens avicola* sp. nov.**

856 *Candidatus* Aphodovivens avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
857 N.L. n. *avicola* inhabitant of birds)

858

859 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
860 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
861 assigned the MAG ID ChiGjej6B6-21069 and which is available via NCBI BioSample  
862 SAMN15817067. The GC content of the type genome is 65.54% and the genome length is 2.2  
863 Mbp.

864

865

866 **Description of *Candidatus Aphodovivens avistercoris* sp. nov.**

867 *Candidatus* Aphodovivens avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
868 dung; N.L. gen. n. *avistercoris* of bird faeces)

869

870 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
871 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
872 assigned the MAG ID ChiGjej5B5-3278 and which is available via NCBI BioSample  
873 SAMN15817093. The GC content of the type genome is 66.86% and the genome length is 2.4  
874 Mbp.

875  
876

877 **Description of *Candidatus Aphodovivens excrementavium* sp. nov.**

878 *Candidatus* Aphodovivens excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
879 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

880

881 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
882 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
883 assigned the MAG ID ChiGjej2B2-30709 and which is available via NCBI BioSample  
884 SAMN15817109. The GC content of the type genome is 58.74% and the genome length is 2.1  
885 Mbp.

886  
887

888 **Description of *Candidatus Aquabacterium excrementipullorum* sp. nov.**

889 *Candidatus* Aquabacterium excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
890 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
891 young chicken excrement)

892

893 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
894 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
895 assigned the MAG ID ChiHile3-4534 and which is available via NCBI BioSample  
896 SAMN15816783. The GC content of the type genome is 67.11% and the genome length is 4.7  
897 Mbp.

898  
899

900 **Description of *Candidatus Atopostipes pullistercoris* sp. nov.**

901 *Candidatus* Atopostipes pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
902 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

903

904 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
905 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
906 assigned the MAG ID CHK169-4300 and which is available via NCBI BioSample  
907 SAMN15816688. The GC content of the type genome is 34.84% and the genome length is 1.9  
908 Mbp.

909  
910

911 **Description of *Candidatus Avacholeplasma* gen. nov.**

912 *Candidatus* Avacholeplasma (Av.a.cho.le.plas'ma. L. fem. n. *avis* bird; N.L. neut. n.  
913 *Acholeplasma* a genus name; N.L. neut. n. *Aviacholeplasma* a genus related to the genus  
914 *Acholeplasma* but distinct from it and found in poultry)

915

916 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
917 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
918 species *Avacholeplasma faecigallinarum*. This genus has been assigned by GTDB-Tk v1.3.0  
919 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
920 *Acholeplasmatales* and to the family *Anaeroplasmataceae*.

921

922

923 **Description of *Candidatus Avacholeplasma faecigallinarum* sp. nov.**

924 *Candidatus Avacholeplasma faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
925 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

926

927 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
928 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
929 assigned the MAG ID 3263 and which is available via NCBI BioSample SAMN15816972. The  
930 GC content of the type genome is 29.88% and the genome length is 1.3 Mbp.

931

932

933 **Description of *Candidatus Avacidaminococcus* gen. nov.**

934 *Candidatus Avacidaminococcus* (Av.a.cid.a.mi.no.coc'cus. L. fem. n. *avis* bird; N.L. masc. n.  
935 *Acidaminococcus* a genus name; N.L. masc. n. *Avacidaminococcus* a genus related to the genus  
936 *Acidaminococcus* but distinct from it and found in poultry)

937

938 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
939 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
940 species *Avacidaminococcus intestinavium*. This genus has been assigned by GTDB-Tk v1.3.0  
941 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
942 *Acidaminococcales* and to the family *Acidaminococcaceae*.

943

944

945 **Description of *Candidatus Avacidaminococcus intestinavium* sp. nov.**

946 *Candidatus Avacidaminococcus intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L.  
947 fem. n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

948

949 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
950 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
951 assigned the MAG ID CHK160-1198 and which is available via NCBI BioSample  
952 SAMN15816987. The GC content of the type genome is 37.45% and the genome length is 1.6  
953 Mbp.

954

955

956 **Description of *Candidatus Avamphibacillus* gen. nov.**

957 *Candidatus Avamphibacillus* (Av.am.phi.ba.cil'lus. L. fem. n. *avis* bird; N.L. masc. n.  
958 *Amphibacillus* a genus name; N.L. masc. n. *Avamphibacillus* a genus related to the genus  
959 *Amphibacillus* but distinct from it and found in poultry)

960

961 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
962 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
963 species *Avamphibacillus intestinigallinarum*. This genus has been assigned by GTDB-Tk v1.3.0  
964 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
965 *Bacillales* and to the family *Amphibacillaceae*.

966  
967

968 **Description of *Candidatus Avamphibacillus intestinigallinarum* sp. nov.**

969 *Candidatus Avamphibacillus intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
970 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

971

972 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
973 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
974 assigned the MAG ID CHK125-3527 and which is available via NCBI BioSample  
975 SAMN15816959. The GC content of the type genome is 36.77% and the genome length is 2.0  
976 Mbp.

977

978

979 **Description of *Candidatus Avanaerovorax* gen. nov.**

980 *Candidatus Avanaerovorax* (Av.an.a.e.ro.vo'rax. L. fem. n. *avis* bird; N.L. masc. n. *Anaerovorax*  
981 a genus name; N.L. masc. n. *Avanaerovorax* a genus related to the genus *Anaerovorax* but  
982 distinct from it and found in poultry)

983

984 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
985 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
986 species *Avanaerovorax faecigallinarum*. This genus has been assigned by GTDB-Tk v1.3.0  
987 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
988 *Peptostreptococcales* and to the family *Anaerovoracaceae*.

989

990

991 **Description of *Candidatus Avanaerovorax faecigallinarum* sp. nov.**

992 *Candidatus Avanaerovorax faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
993 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

994

995 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
996 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
997 assigned the MAG ID Gambia13-1450 and which is available via NCBI BioSample  
998 SAMN15816994. The GC content of the type genome is 48.68% and the genome length is 1.8  
999 Mbp.

1000

1001

1002 **Description of *Candidatus Aveggerthella* gen. nov.**

1003 *Candidatus Aveggerthella* (Av.eg.ger.thel'la. L. fem. n. *avis* bird; N.L. fem. n. *Eggerthella* a  
1004 genus name; N.L. fem. n. *Aveggerthella* a genus related to the genus *Eggerthella* but distinct  
1005 from it and found in poultry)

1006

1007 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1008 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1009 species *Avieggerthella excrementigallinarum*. This genus has been assigned by GTDB-Tk v1.3.0  
1010 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1011 *Coriobacteriales* and to the family *Eggerthellaceae*.

1012  
1013

1014 **Description of *Candidatus Aveggerthella excrementigallinarum* sp. nov.**

1015 *Candidatus Aveggerthella excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
1016 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
1017 excrement)

1018

1019 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1020 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1021 assigned the MAG ID ChiGjej4B4-3573 and which is available via NCBI BioSample  
1022 SAMN15816976. The GC content of the type genome is 65.93% and the genome length is 2.0  
1023 Mbp.

1024

1025

1026 **Description of *Candidatus Aveggerthella stercoripullorum* sp. nov.**

1027 *Candidatus Aveggerthella stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
1028 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

1029

1030 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1031 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1032 assigned the MAG ID ChiGjej1B1-2707 and which is available via NCBI BioSample  
1033 SAMN15816950. The GC content of the type genome is 61.50% and the genome length is 2.1  
1034 Mbp.

1035

1036

1037 **Description of *Candidatus Avelusimicrobium* gen. nov.**

1038 *Candidatus Avelusimicrobium* (Av.e.lu.si.mi.cro'bi.um. L. fem. n. *avis* bird; N.L. neut. n.  
1039 *Elusimicrobium* a genus name; N.L. neut. n. *Avelusimicrobium* a genus related to the genus  
1040 *Elusimicrobium* but distinct from it and found in poultry)

1041

1042 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1043 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1044 species *Avielusimicrobium excrementipullorum*. This genus has been assigned by GTDB-Tk  
1045 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
1046 order *Elusimicrobiales* and to the family *Elusimicrobiaceae*.

1047

1048

1049 **Description of *Candidatus Avelusimicrobium excrementipullorum* sp. nov.**

1050 *Candidatus Avelusimicrobium excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
1051 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
1052 young chicken excrement)

1053

1054 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1055 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1056 assigned the MAG ID CHK136-6324 and which is available via NCBI BioSample  
1057 SAMN15817002. The GC content of the type genome is 53.46% and the genome length is 1.3  
1058 Mbp.

1059

1060

1061 **Description of *Candidatus Avibacteroides* gen. nov.**

1062 *Candidatus Avibacteroides* (A.vi.bac.te.ro'i.des. L. fem. n. *avis* bird; N.L. masc. n. *Bacteroides* a  
1063 genus name; N.L. masc. n. *Avibacteroides* a genus related to the genus *Bacteroides* but distinct  
1064 from it and found in poultry)

1065

1066 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1067 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1068 species *Avibacteroides excrementipullorum*. This genus has been assigned by GTDB-Tk v1.3.0  
1069 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1070 *Bacteroidales* and to the family *Bacteroidaceae*.

1071

1072

1073 **Description of *Candidatus Avibacteroides avistercoris* sp. nov.**

1074 *Candidatus Avibacteroides avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
1075 dung; N.L. gen. n. *avistercoris* of bird faeces)

1076

1077 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1078 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1079 assigned the MAG ID MalCec1-1739 and which is available via NCBI BioSample  
1080 SAMN15816974. The GC content of the type genome is 53.14% and the genome length is 2.2  
1081 Mbp.

1082

1083

1084 **Description of *Candidatus Avibacteroides excrementipullorum* sp. nov.**

1085 *Candidatus Avibacteroides excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
1086 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
1087 young chicken excrement)

1088

1089 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1090 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1091 assigned the MAG ID ChiHjej12B11-16860 and which is available via NCBI BioSample  
1092 SAMN15816958. The GC content of the type genome is 47.79% and the genome length is 2.2  
1093 Mbp.

1094

1095

1096 **Description of *Candidatus Avibacteroides faecavium* sp. nov.**

1097 *Candidatus Avibacteroides faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
1098 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

1099

1100 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1101 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1102 assigned the MAG ID 3702 and which is available via NCBI BioSample SAMN15816980. The  
1103 GC content of the type genome is 55.42% and the genome length is 2.1 Mbp.

1104

1105

1106 **Description of *Candidatus Avichristensenella* gen. nov.**

1107 *Candidatus Avichristensenella* (A.vi.chris.ten.sen.el'la. L. fem. n. *avis* bird; N.L. fem. n.  
1108 *Christensenella* a genus name; N.L. fem. n. *Avichristensenella* a genus related to the genus  
1109 *Christensenella* but distinct from it and found in poultry)

1110

1111 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1112 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1113 species *Avichristensenella intestinipullorum*. This genus has been assigned by GTDB-Tk v1.3.0  
1114 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1115 *Christensenellales* and to the family *CAG-74*.

1116

1117

1118 **Description of *Candidatus Avichristensenella intestinipullorum* sp. nov.**

1119 *Candidatus Avichristensenella intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum*  
1120 gut; L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young  
1121 chickens)

1122

1123 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1124 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1125 assigned the MAG ID ChiHile30-977 and which is available via NCBI BioSample  
1126 SAMN15816947. The GC content of the type genome is 63.80% and the genome length is 2.3  
1127 Mbp.

1128

1129

1130 **Description of *Candidatus Avidahalobacter* gen. nov.**

1131 *Candidatus Avidahalobacter* (A.vi.de.ha.lo.bac'ter. L. fem. n. *avis* bird; N.L. masc. n.  
1132 *Dehalobacter* a genus name; N.L. masc. n. *Avidahalobacter* a genus related to the genus  
1133 *Dehalobacter* but distinct from it and found in poultry)

1134

1135 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1136 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1137 species *Avidahalobacter gallistercoris*. This genus has been assigned by GTDB-Tk v1.3.0  
1138 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1139 *UBA4068* and to the family *UBA5755*.

1140

1141

1142 **Description of *Candidatus Avidahalobacter gallistercoris* sp. nov.**

1143 *Candidatus Avidahalobacter gallistercoris* (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n.  
1144 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

1145

1146 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1147 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1148 assigned the MAG ID 2830 and which is available via NCBI BioSample SAMN15816981. The  
1149 GC content of the type genome is 52.20% and the genome length is 1.4 Mbp.

1150

1151

1152 **Description of *Candidatus Avidesulfovibrio* gen. nov.**

1153 *Candidatus Avidesulfovibrio* (A.vi.de.sul.fo.vi'bri.o. L. fem. n. *avis* bird; N.L. masc. n.

1154 *Desulfovibrio* a genus name; N.L. masc. n. *Avidesulfovibrio* a genus related to the genus

1155 *Desulfovibrio* but distinct from it and found in poultry)

1156

1157 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1158 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1159 species *Avidesulfovibrio excrementigallinarum*. This genus has been assigned by GTDB-Tk  
1160 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
1161 order *Desulfovibrionales* and to the family *Desulfovibrionaceae*.

1162

1163

1164 **Description of *Candidatus Avidesulfovibrio excrementigallinarum* sp. nov.**

1165 *Candidatus Avidesulfovibrio excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.

1166 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen

1167 excrement)

1168

1169 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1170 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1171 assigned the MAG ID ChiHcec4-2777 and which is available via NCBI BioSample  
1172 SAMN15816982. The GC content of the type genome is 60.70% and the genome length is 2.2  
1173 Mbp.

1174

1175

1176 **Description of *Candidatus Avigastranaerophilus* gen. nov.**

1177 *Candidatus Avigastranaerophilus* (A.vi.gastr.an.a.e.ro'phi.lus. L. fem. n. *avis* bird; N.L. masc. n.

1178 *Gastranaerophilus* a genus name; N.L. masc. n. *Avigastranaerophilus* a genus related to the

1179 genus *Gastranaerophilus* but distinct from it and found in poultry)

1180

1181 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1182 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1183 species *Avigastranaerophilus faecigallinarum*. This genus has been assigned by GTDB-Tk  
1184 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
1185 order *Gastranaerophilales* and to the family *Gastranaerophilaceae*.

1186

1187

1188 **Description of *Candidatus Avigastranaerophilus faecigallinarum* sp. nov.**

1189 *Candidatus Avigastranaerophilus faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*

1190 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

1191

1192 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1193 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1194 assigned the MAG ID 5572 and which is available via NCBI BioSample SAMN15816968. The  
1195 GC content of the type genome is 29.33% and the genome length is 2.2 Mbp.

1196

1197

1198 **Description of *Candidatus Avilachnospira* gen. nov.**

1199 *Candidatus Avilachnospira* (A.vi.lach.no.spi'ra. L. fem. n. *avis* bird; N.L. fem. n. *Lachnospira* a  
1200 genus name; N.L. fem. n. *Avilachnospira* a genus related to the genus *Lachnospira* but distinct  
1201 from it and found in poultry)

1202

1203 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1204 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1205 species *Avilachnospira avistercoris*. This genus has been assigned by GTDB-Tk v1.3.0 working  
1206 on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1207 *Lachnospirales* and to the family *Lachnospiraceae*.

1208

1209

1210 **Description of *Candidatus Avilachnospira avicola* sp. nov.**

1211 *Candidatus Avilachnospira avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
1212 N.L. n. *avicola* inhabitant of birds)

1213

1214 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1215 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1216 assigned the MAG ID ChiHecec3B27-5021 and which is available via NCBI BioSample  
1217 SAMN15816990. The GC content of the type genome is 49.15% and the genome length is 1.6  
1218 Mbp.

1219

1220

1221 **Description of *Candidatus Avilachnospira avistercoris* sp. nov.**

1222 *Candidatus Avilachnospira avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
1223 dung; N.L. gen. n. *avistercoris* of bird faeces)

1224

1225 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1226 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1227 assigned the MAG ID ChiGjej5B5-15814 and which is available via NCBI BioSample  
1228 SAMN15816991. The GC content of the type genome is 50.02% and the genome length is 1.6  
1229 Mbp.

1230

1231

1232 **Description of *Candidatus Avimonoglobus* gen. nov.**

1233 *Candidatus Avimonoglobus* (A.vi.mo.no.glo'bus. L. fem. n. *avis* bird; N.L. masc. n. *Monoglobus*  
1234 a genus name; N.L. masc. n. *Avimonoglobus* a genus related to the genus *Monoglobus* but  
1235 distinct from it and found in poultry)

1236

1237 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1238 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1239 species *Avimonoglobus intestinipullorum*. This genus has been assigned by GTDB-Tk v1.3.0  
1240 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1241 *Monoglobales*\_A and to the family *UBA1381*.

1242  
1243

1244 **Description of *Candidatus Avimonoglobus intestinipullorum* sp. nov.**

1245 *Candidatus Avimonoglobus intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut;  
1246 L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

1247

1248 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1249 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1250 assigned the MAG ID ChiSjej4B22-9803 and which is available via NCBI BioSample  
1251 SAMN15816985. The GC content of the type genome is 51.95% and the genome length is 1.8  
1252 Mbp.

1253

1254

1255 **Description of *Candidatus Avimuribaculum* gen. nov.**

1256 *Candidatus Avimuribaculum* (A.vi.mu.ri.ba'cu.lum. L. fem. n. *avis* bird; N.L. neut. n.  
1257 *Muribaculum* a genus name; N.L. neut. n. *Avimuribaculum* a genus related to the genus  
1258 *Muribaculum* but distinct from it and found in poultry)

1259

1260 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1261 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1262 species *Avimuribaculum pullicola*. This genus has been assigned by GTDB-Tk v1.3.0 working  
1263 on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales*  
1264 and to the family *Muribaculaceae*.

1265

1266

1267 **Description of *Candidatus Avimuribaculum pullicola* sp. nov.**

1268 *Candidatus Avimuribaculum pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
1269 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

1270

1271 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1272 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1273 assigned the MAG ID ChiHecec3B27-9160 and which is available via NCBI BioSample  
1274 SAMN15816969. The GC content of the type genome is 47.58% and the genome length is 2.2  
1275 Mbp.

1276

1277

1278 **Description of *Candidatus Aviproponibacterium* gen. nov.**

1279 *Candidatus Aviproponibacterium* (A.vi.pro.pi.o.ni.bac.te'ri.um. L. fem. n. *avis* bird; N.L. neut.  
1280 n. *Propionibacterium* a genus name; N.L. neut. n. *Aviproponibacterium* a genus related to the  
1281 genus *Propionibacterium* but distinct from it and found in poultry)

1282

1283 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1284 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1285 species *Aviproionibacterium avicola*. This genus has been assigned by GTDB-Tk v1.3.0  
1286 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1287 *Propionibacteriales* and to the family *Propionibacteriaceae*.

1288  
1289

1290 **Description of *Candidatus Aviproionibacterium avicola* sp. nov.**

1291 *Candidatus Aviproionibacterium avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola*  
1292 inhabitant of; N.L. n. *avicola* inhabitant of birds)

1293

1294 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1295 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1296 assigned the MAG ID ChiGjej1B1-24693 and which is available via NCBI BioSample  
1297 SAMN15816979. The GC content of the type genome is 69.14% and the genome length is 3.2  
1298 Mbp.

1299

1300

1301 **Description of *Candidatus Avirkenella* gen. nov.**

1302 *Candidatus Avirkenella* (A.vi.ri.ke.nel'la. L. fem. n. *avis* bird; N.L. fem. n. *Rikenella* a genus  
1303 name; N.L. fem. n. *Avirkenella* a genus related to the genus *Rikenella* but distinct from it and  
1304 found in poultry)

1305

1306 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1307 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1308 species *Avirkenella pullistercoris*. This genus has been assigned by GTDB-Tk v1.3.0 working  
1309 on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales*  
1310 and to the family *Rikenellaceae*.

1311

1312

1313 **Description of *Candidatus Avirkenella pullistercoris* sp. nov.**

1314 *Candidatus Avirkenella pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
1315 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

1316

1317 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1318 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1319 assigned the MAG ID 9321 and which is available via NCBI BioSample SAMN15816960. The  
1320 GC content of the type genome is 41.91% and the genome length is 1.9 Mbp.

1321

1322

1323 **Description of *Candidatus Avisuccinivibrio* gen. nov.**

1324 *Candidatus Avisuccinivibrio* (A.vi.suc.ci.ni.vi'bri.o. L. fem. n. *avis* bird; N.L. masc. n.  
1325 *Succinivibrio* a genus name; N.L. masc. n. *Avisuccinivibrio* a genus related to the genus  
1326 *Succinivibrio* but distinct from it and found in poultry)

1327

1328 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1329 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1330 species *Avisuccinivibrio stercorigallinarum*. This genus has been assigned by GTDB-Tk v1.3.0  
1331 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1332 *Enterobacterales* and to the family *Succinivibrionaceae*.

1333  
1334

1335 **Description of *Candidatus Avisuccinivibrio pullicola* sp. nov.**

1336 *Candidatus Avisuccinivibrio pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
1337 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

1338

1339 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1340 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1341 assigned the MAG ID 3820 and which is available via NCBI BioSample SAMN15816999. The  
1342 GC content of the type genome is 55.94% and the genome length is 2.4 Mbp.

1343

1344

1345 **Description of *Candidatus Avisuccinivibrio stercorigallinarum* sp. nov.**

1346 *Candidatus Avisuccinivibrio stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung;  
1347 L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

1348

1349 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1350 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1351 assigned the MAG ID 17213 and which is available via NCBI BioSample SAMN15817000. The  
1352 GC content of the type genome is 54.49% and the genome length is 2.4 Mbp.

1353

1354

1355 **Description of *Candidatus Avitreponema* gen. nov.**

1356 *Candidatus Avitreponema* (A.vi.tre.po.ne'ma. L. fem. n. *avis* bird; N.L. neut. n. *Treponema* a  
1357 genus name; N.L. neut. n. *Avitreponema* a genus related to the genus *Treponema* but distinct  
1358 from it and found in poultry)

1359

1360 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1361 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1362 species *Avitreponema avistercoris*. This genus has been assigned by GTDB-Tk v1.3.0 working  
1363 on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1364 *Treponematales* and to the family *Treponemataceae*.

1365

1366

1367 **Description of *Candidatus Avitreponema avistercoris* sp. nov.**

1368 *Candidatus Avitreponema avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
1369 dung; N.L. gen. n. *avistercoris* of bird faeces)

1370

1371 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1372 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

1373 assigned the MAG ID B3-4054 and which is available via NCBI BioSample SAMN15816977.  
1374 The GC content of the type genome is 55.36% and the genome length is 1.9 Mbp.

1375  
1376

1377 **Description of *Candidatus Avosillospira* gen. nov.**

1378 *Candidatus Avosillospira* (Av.os.cil.lo.spi'ra. L. fem. n. *avis* bird; N.L. fem. n. *Oscillospira* a  
1379 genus name; N.L. fem. n. *Avosillospira* a genus related to the genus *Oscillospira* but distinct  
1380 from it and found in poultry)

1381

1382 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
1383 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
1384 species *Avosillospira stercorigallinarum*. This genus has been assigned by GTDB-Tk v1.3.0  
1385 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
1386 *Oscillospirales* and to the family *Oscillospiraceae*.

1387

1388

1389 **Description of *Candidatus Avosillospira avicola* sp. nov.**

1390 *Candidatus Avosillospira avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
1391 N.L. n. *avicola* inhabitant of birds)

1392

1393 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1394 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1395 assigned the MAG ID ChiBcec15-4380 and which is available via NCBI BioSample  
1396 SAMN15816934. The GC content of the type genome is 61.76% and the genome length is 2.5  
1397 Mbp.

1398

1399

1400 **Description of *Candidatus Avosillospira avistercoris* sp. nov.**

1401 *Candidatus Avosillospira avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
1402 dung; N.L. gen. n. *avistercoris* of bird faeces)

1403

1404 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1405 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1406 assigned the MAG ID ChiBcec16-1751 and which is available via NCBI BioSample  
1407 SAMN15816964. The GC content of the type genome is 58.00% and the genome length is 2.4  
1408 Mbp.

1409

1410

1411 **Description of *Candidatus Avosillospira stercorigallinarum* sp. nov.**

1412 *Candidatus Avosillospira stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
1413 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

1414

1415 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1416 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1417 assigned the MAG ID ChiSjej2B20-13462 and which is available via NCBI BioSample

1418 SAMN15816948. The GC content of the type genome is 63.01% and the genome length is 2.2  
1419 Mbp.

1420  
1421

1422 **Description of *Candidatus Avoscollospira stercoripullorum* sp. nov.**

1423 *Candidatus Avoscollospira stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
1424 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

1425

1426 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1427 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1428 assigned the MAG ID ChiHjej9B8-7071 and which is available via NCBI BioSample

1429 SAMN15816951. The GC content of the type genome is 60.69% and the genome length is 1.9  
1430 Mbp.

1431

1432

1433 **Description of *Candidatus Bacteroides avicola* sp. nov.**

1434 *Candidatus Bacteroides avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
1435 n. *avicola* inhabitant of birds)

1436

1437 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1438 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1439 assigned the MAG ID ChiHjej12B11-9795 and which is available via NCBI BioSample

1440 SAMN15816830. This is a new name for the alphanumeric GTDB species sp002160055. The  
1441 GC content of the type genome is 50.12% and the genome length is 3.0 Mbp.

1442

1443

1444 **Description of *Candidatus Bacteroides intestinavium* sp. nov.**

1445 *Candidatus Bacteroides intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
1446 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

1447

1448 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1449 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1450 assigned the MAG ID ChiHecec1B25-7008 and which is available via NCBI BioSample

1451 SAMN15816665. The GC content of the type genome is 54.17% and the genome length is 2.6  
1452 Mbp.

1453

1454

1455 **Description of *Candidatus Bacteroides intestinigallarum* sp. nov.**

1456 *Candidatus Bacteroides intestinigallarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
1457 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

1458

1459 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1460 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1461 assigned the MAG ID 2926 and which is available via NCBI BioSample SAMN15816831. This

1462 is a new name for the alphanumeric GTDB species sp003463205. The GC content of the type  
1463 genome is 41.82% and the genome length is 5.8 Mbp.

1464

1465

**Description of *Candidatus Bacteroides intestinipullorum* sp. nov.**

1467 *Candidatus Bacteroides intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
1468 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

1469

1470 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1471 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1472 assigned the MAG ID B3-3758 and which is available via NCBI BioSample SAMN15816671.  
1473 The GC content of the type genome is 53.99% and the genome length is 2.7 Mbp.

1474

1475

**Description of *Candidatus Bacteroides merdaviium* sp. nov.**

1477 *Candidatus Bacteroides merdaviium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
1478 N.L. gen. n. *merdaviium* of bird faeces)

1479

1480 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1481 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1482 assigned the MAG ID CHK118-2852 and which is available via NCBI BioSample  
1483 SAMN15816687. The GC content of the type genome is 49.76% and the genome length is 2.9  
1484 Mbp.

1485

1486

**Description of *Candidatus Bacteroides merdigallarum* sp. nov.**

1488 *Candidatus Bacteroides merdigallarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
1489 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

1490

1491 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1492 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1493 assigned the MAG ID ChiHjej9B8-1298 and which is available via NCBI BioSample  
1494 SAMN15816694. The GC content of the type genome is 54.52% and the genome length is 2.7  
1495 Mbp.

1496

1497

**Description of *Candidatus Bacteroides merdipullorum* sp. nov.**

1499 *Candidatus Bacteroides merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
1500 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

1501

1502 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1503 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1504 assigned the MAG ID ChiHjej12B11-24981 and which is available via NCBI BioSample  
1505 SAMN15816699. The GC content of the type genome is 53.73% and the genome length is 2.5  
1506 Mbp.

1507

1508

**Description of *Candidatus Bacteroides pullicola* sp. nov.**

1509

1510 *Candidatus* Bacteroides pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
1511 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

1512  
1513 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1514 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1515 assigned the MAG ID Gambia2-208 and which is available via NCBI BioSample  
1516 SAMN15816704. The GC content of the type genome is 55.18% and the genome length is 2.7  
1517 Mbp.

1518  
1519

1520 **Description of *Candidatus* Bariatricus faecipullorum sp. nov.**

1521 *Candidatus* Bariatricus faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
1522 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

1523

1524 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1525 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1526 assigned the MAG ID 9095 and which is available via NCBI BioSample SAMN15816662. The  
1527 GC content of the type genome is 51.54% and the genome length is 2.5 Mbp.

1528  
1529

1530 **Description of *Candidatus* Barnesiella excrementavium sp. nov.**

1531 *Candidatus* Barnesiella excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
1532 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

1533

1534 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1535 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1536 assigned the MAG ID 4398 and which is available via NCBI BioSample SAMN15816714. The  
1537 GC content of the type genome is 52.73% and the genome length is 2.7 Mbp.

1538  
1539

1540 **Description of *Candidatus* Barnesiella excrementigallarum sp. nov.**

1541 *Candidatus* Barnesiella excrementigallarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
1542 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
1543 excrement)

1544

1545 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1546 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1547 assigned the MAG ID CHK169-14362 and which is available via NCBI BioSample  
1548 SAMN15816739. The GC content of the type genome is 47.04% and the genome length is 2.6  
1549 Mbp.

1550  
1551

1552 **Description of *Candidatus* Barnesiella excrementipullorum sp. nov.**

1553 *Candidatus* Barnesiella excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
1554 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
1555 chicken excrement)

1556

1557 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1558 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1559 assigned the MAG ID ChiHjej12B11-16260 and which is available via NCBI BioSample  
1560 SAMN15816862. This is a new name for the alphanumeric GTDB species sp900542255. The  
1561 GC content of the type genome is 50.69% and the genome length is 2.1 Mbp.

1562

1563

1564 **Description of *Candidatus Barnesiella merdigallarum* sp. nov.**

1565 *Candidatus Barnesiella merdigallarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
1566 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

1567

1568 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1569 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1570 assigned the MAG ID CHK136-6590 and which is available via NCBI BioSample  
1571 SAMN15816819. This is a new name for the alphanumeric GTDB species sp002159975. The  
1572 GC content of the type genome is 54.15% and the genome length is 2.7 Mbp.

1573

1574

1575 **Description of *Candidatus Barnesiella merdipullorum* sp. nov.**

1576 *Candidatus Barnesiella merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
1577 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

1578

1579 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1580 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1581 assigned the MAG ID 5648 and which is available via NCBI BioSample SAMN15816849. This  
1582 is a new name for the alphanumeric GTDB species sp002161555. The GC content of the type  
1583 genome is 52.62% and the genome length is 2.6 Mbp.

1584

1585

1586 **Description of *Candidatus Bilophila faecipullorum* sp. nov.**

1587 *Candidatus Bilophila faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
1588 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

1589

1590 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1591 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1592 assigned the MAG ID ChiSxjej5B17-1746 and which is available via NCBI BioSample  
1593 SAMN15816754. The GC content of the type genome is 63.22% and the genome length is 2.8  
1594 Mbp.

1595

1596

1597 **Description of *Candidatus Blautia avicola* sp. nov.**

1598 *Candidatus Blautia avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
1599 *avicola* inhabitant of birds)

1600

1601 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1602 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1603 assigned the MAG ID ChiBceec6-4105 and which is available via NCBI BioSample  
1604 SAMN15816794. The GC content of the type genome is 46.40% and the genome length is 3.1  
1605 Mbp.

1606  
1607

1608 **Description of *Candidatus Blautia avistercoris* sp. nov.**

1609 *Candidatus* Blautia avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
1610 N.L. gen. n. *avistercoris* of bird faeces)

1611

1612 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1613 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1614 assigned the MAG ID 5548 and which is available via NCBI BioSample SAMN15816924. This  
1615 is a new name for the alphanumeric GTDB species sp002159835. Although GTDB has assigned  
1616 this species to the genus it calls Blautia\_A , this genus designation cannot be incorporated into a  
1617 well-formed binomial, so in naming this species, we have used the current validly published  
1618 name for the genus. The GC content of the type genome is 45.38% and the genome length is 2.5  
1619 Mbp.

1620  
1621

1622 **Description of *Candidatus Blautia excrementigallinarum* sp. nov.**

1623 *Candidatus* Blautia excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n. *excrementum*  
1624 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen excrement)

1625

1626 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1627 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1628 assigned the MAG ID ChiSjej6B24-370 and which is available via NCBI BioSample  
1629 SAMN15816894. Although GTDB has assigned this species to the genus it calls Blautia\_A , this  
1630 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
1631 we have used the current validly published name for the genus. The GC content of the type  
1632 genome is 49.44% and the genome length is 2.3 Mbp.

1633  
1634

1635 **Description of *Candidatus Blautia excrementipullorum* sp. nov.**

1636 *Candidatus* Blautia excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
1637 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
1638 chicken excrement)

1639

1640 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1641 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1642 assigned the MAG ID CHK197-7439 and which is available via NCBI BioSample  
1643 SAMN15816885. Although GTDB has assigned this species to the genus it calls Blautia\_A , this  
1644 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
1645 we have used the current validly published name for the genus. The GC content of the type  
1646 genome is 46.79% and the genome length is 3.3 Mbp.

1647

1648

**Description of *Candidatus Blautia faecavium* sp. nov.**

1650 *Candidatus* Blautia faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
1651 bird; N.L. gen. n. *faecavium* of bird faeces)

1652

1653 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1654 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1655 assigned the MAG ID ChiSjej1B19-5720 and which is available via NCBI BioSample  
1656 SAMN15816886. Although GTDB has assigned this species to the genus it calls Blautia\_A , this  
1657 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
1658 we have used the current validly published name for the genus. The GC content of the type  
1659 genome is 45.35% and the genome length is 3.5 Mbp.

1660

1661

**Description of *Candidatus Blautia faecigallinarum* sp. nov.**

1663 *Candidatus* Blautia faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
1664 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

1665

1666 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1667 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1668 assigned the MAG ID 14324 and which is available via NCBI BioSample SAMN15816901.  
1669 Although GTDB has assigned this species to the genus it calls Blautia\_A , this genus designation  
1670 cannot be incorporated into a well-formed binomial, so in naming this species, we have used the  
1671 current validly published name for the genus. The GC content of the type genome is 48.52% and  
1672 the genome length is 2.9 Mbp.

1673

1674

**Description of *Candidatus Blautia faecipullorum* sp. nov.**

1676 *Candidatus* Blautia faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L. masc.  
1677 n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

1678

1679 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1680 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1681 assigned the MAG ID ChiSxjej6B18-2004 and which is available via NCBI BioSample  
1682 SAMN15816906. Although GTDB has assigned this species to the genus it calls Blautia\_A , this  
1683 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
1684 we have used the current validly published name for the genus. The GC content of the type  
1685 genome is 48.18% and the genome length is 3.5 Mbp.

1686

1687

**Description of *Candidatus Blautia gallistercoris* sp. nov.**

1689 *Candidatus* Blautia gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n. *stercus*  
1690 dung; N.L. gen. n. *gallistercoris* of chicken faeces)

1691

1692 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1693 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1694 assigned the MAG ID ChiSjej1B19-8411 and which is available via NCBI BioSample  
1695 SAMN15816925. This is a new name for the alphanumeric GTDB species sp900542045.  
1696 Although GTDB has assigned this species to the genus it calls *Blautia\_A*, this genus designation  
1697 cannot be incorporated into a well-formed binomial, so in naming this species, we have used the  
1698 current validly published name for the genus. The GC content of the type genome is 48.96% and  
1699 the genome length is 2.8 Mbp.

1700

1701

1702 **Description of *Candidatus Blautia intestinavium* sp. nov.**

1703 *Candidatus Blautia intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n. *avis*  
1704 bird; N.L. gen. n. *intestinavium* of the gut of birds)

1705

1706 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1707 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1708 assigned the MAG ID CHK186-553 and which is available via NCBI BioSample  
1709 SAMN15816890. Although GTDB has assigned this species to the genus it calls *Blautia\_A*, this  
1710 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
1711 we have used the current validly published name for the genus. The GC content of the type  
1712 genome is 47.27% and the genome length is 2.8 Mbp.

1713

1714

1715 **Description of *Candidatus Blautia intestinigallinarum* sp. nov.**

1716 *Candidatus Blautia intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.  
1717 fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

1718

1719 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1720 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1721 assigned the MAG ID CHK186-9876 and which is available via NCBI BioSample  
1722 SAMN15816891. Although GTDB has assigned this species to the genus it calls *Blautia\_A*, this  
1723 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
1724 we have used the current validly published name for the genus. The GC content of the type  
1725 genome is 46.77% and the genome length is 2.7 Mbp.

1726

1727

1728 **Description of *Candidatus Blautia intestinipullorum* sp. nov.**

1729 *Candidatus Blautia intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L. masc.  
1730 n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

1731

1732 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1733 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1734 assigned the MAG ID ChiW16-4312 and which is available via NCBI BioSample  
1735 SAMN15816892. Although GTDB has assigned this species to the genus it calls *Blautia\_A*, this  
1736 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,

1737 we have used the current validly published name for the genus. The GC content of the type  
1738 genome is 47.05% and the genome length is 2.4 Mbp.

1739  
1740

1741 **Description of *Candidatus Blautia merdavium* sp. nov.**

1742 *Candidatus* Blautia merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird; N.L.  
1743 gen. n. *merdavium* of bird faeces)

1744

1745 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1746 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1747 assigned the MAG ID ChiBcec2-3848 and which is available via NCBI BioSample  
1748 SAMN15816633. The GC content of the type genome is 48.60% and the genome length is 3.3  
1749 Mbp.

1750

1751

1752 **Description of *Candidatus Blautia merdigallarum* sp. nov.**

1753 *Candidatus* Blautia merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n.  
1754 *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

1755

1756 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1757 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1758 assigned the MAG ID ChiSxjej6B18-287 and which is available via NCBI BioSample  
1759 SAMN15816815. This is a new name for the alphanumeric GTDB species sp900543715. The  
1760 GC content of the type genome is 45.18% and the genome length is 3.3 Mbp.

1761

1762

1763 **Description of *Candidatus Blautia merdipullorum* sp. nov.**

1764 *Candidatus* Blautia merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
1765 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

1766

1767 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1768 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1769 assigned the MAG ID 17058 and which is available via NCBI BioSample SAMN15816655. The  
1770 GC content of the type genome is 45.05% and the genome length is 3.2 Mbp.

1771

1772

1773 **Description of *Candidatus Blautia ornithocaccae* sp. nov.**

1774 *Candidatus* Blautia ornithocaccae (or.ni.tho.cac'cae. Gr. masc. or fem. n. *ornis*, *ornithos* bird Gr.  
1775 fem. n. *kakke* faeces; N.L. gen. n. *ornithocaccae* of bird faeces)

1776

1777 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1778 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1779 assigned the MAG ID ChiBcec1-3711 and which is available via NCBI BioSample  
1780 SAMN15816880. This is a new name for the alphanumeric GTDB species sp002161285. The  
1781 GC content of the type genome is 44.79% and the genome length is 3.1 Mbp.

1782

1783

**1784 Description of *Candidatus Blautia pullicola* sp. nov.**

1785 *Candidatus* Blautia pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
1786 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

1787

1788 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1789 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1790 assigned the MAG ID 1068 and which is available via NCBI BioSample SAMN15816689. The  
1791 GC content of the type genome is 45.62% and the genome length is 3.0 Mbp.

1792

1793

**1794 Description of *Candidatus Blautia pullistercoris* sp. nov.**

1795 *Candidatus* Blautia pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L. neut. n.  
1796 *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

1797

1798 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1799 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1800 assigned the MAG ID ChiHjej12B11-1927 and which is available via NCBI BioSample  
1801 SAMN15816618. The GC content of the type genome is 45.73% and the genome length is 3.2  
1802 Mbp.

1803

1804

**1805 Description of *Candidatus Blautia stercoravium* sp. nov.**

1806 *Candidatus* Blautia stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis* bird;  
1807 N.L. gen. n. *stercoravium* of bird faeces)

1808

1809 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1810 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1811 assigned the MAG ID 3268 and which is available via NCBI BioSample SAMN15816738. The  
1812 GC content of the type genome is 44.17% and the genome length is 2.7 Mbp.

1813

1814

**1815 Description of *Candidatus Blautia stercorigallinarum* sp. nov.**

1816 *Candidatus* Blautia stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L. fem.  
1817 n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

1818

1819 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1820 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1821 assigned the MAG ID CHK195-9823 and which is available via NCBI BioSample  
1822 SAMN15816627. The GC content of the type genome is 45.83% and the genome length is 3.1  
1823 Mbp.

1824

1825

**1826 Description of *Candidatus Blautia stercoripullorum* sp. nov.**

1827 *Candidatus* Blautia stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc. n.  
1828 *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

1829

1830 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1831 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1832 assigned the MAG ID ChiW19-6364 and which is available via NCBI BioSample  
1833 SAMN15816793. The GC content of the type genome is 44.78% and the genome length is 3.1  
1834 Mbp.

1835

1836

1837 **Description of *Candidatus Borkfalkia avicola* sp. nov.**

1838 *Candidatus Borkfalkia avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
1839 n. *avicola* inhabitant of birds)

1840

1841 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1842 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1843 assigned the MAG ID CHK192-19661 and which is available via NCBI BioSample  
1844 SAMN15816606. The GC content of the type genome is 58.92% and the genome length is 1.7  
1845 Mbp.

1846

1847

1848 **Description of *Candidatus Borkfalkia avistercoris* sp. nov.**

1849 *Candidatus Borkfalkia avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
1850 N.L. gen. n. *avistercoris* of bird faeces)

1851

1852 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1853 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1854 assigned the MAG ID CHK187-5294 and which is available via NCBI BioSample  
1855 SAMN15816607. The GC content of the type genome is 53.99% and the genome length is 1.7  
1856 Mbp.

1857

1858

1859 **Description of *Candidatus Borkfalkia excrementavium* sp. nov.**

1860 *Candidatus Borkfalkia excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
1861 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

1862

1863 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1864 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1865 assigned the MAG ID CHK199-9574 and which is available via NCBI BioSample  
1866 SAMN15816608. The GC content of the type genome is 52.76% and the genome length is 1.6  
1867 Mbp.

1868

1869

1870 **Description of *Candidatus Borkfalkia excrementigallarum* sp. nov.**

1871 *Candidatus Borkfalkia excrementigallarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
1872 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
1873 excrement)

1874

1875 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1876 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1877 assigned the MAG ID 1345 and which is available via NCBI BioSample SAMN15816609. The  
1878 GC content of the type genome is 53.42% and the genome length is 1.9 Mbp.

1879  
1880

1881 **Description of *Candidatus Borkfalkia excrementipullorum* sp. nov.**

1882 *Candidatus Borkfalkia excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
1883 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
1884 chicken excrement)

1885

1886 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1887 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1888 assigned the MAG ID CHK192-2667 and which is available via NCBI BioSample  
1889 SAMN15816611. The GC content of the type genome is 55.63% and the genome length is 1.6  
1890 Mbp.

1891

1892

1893 **Description of *Candidatus Borkfalkia faecavium* sp. nov.**

1894 *Candidatus Borkfalkia faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
1895 bird; N.L. gen. n. *faecavium* of bird faeces)

1896

1897 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1898 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1899 assigned the MAG ID 2189 and which is available via NCBI BioSample SAMN15816731. The  
1900 GC content of the type genome is 58.98% and the genome length is 1.7 Mbp.

1901

1902

1903 **Description of *Candidatus Borkfalkia faecigallinarum* sp. nov.**

1904 *Candidatus Borkfalkia faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
1905 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

1906

1907 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1908 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1909 assigned the MAG ID 26628 and which is available via NCBI BioSample SAMN15816617. The  
1910 GC content of the type genome is 62.49% and the genome length is 1.6 Mbp.

1911

1912

1913 **Description of *Candidatus Borkfalkia faecipullorum* sp. nov.**

1914 *Candidatus Borkfalkia faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
1915 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

1916

1917 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1918 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1919 assigned the MAG ID 811 and which is available via NCBI BioSample SAMN15816621. The  
1920 GC content of the type genome is 54.29% and the genome length is 1.9 Mbp.

**Description of *Candidatus Borkfalkia stercoripullorum* sp. nov.**

*Candidatus* Borkfalkia stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID CHK196-13738 and which is available via NCBI BioSample SAMN15816588. The GC content of the type genome is 55.22% and the genome length is 1.8 Mbp.

**Description of *Candidatus Brachybacterium intestinipullorum* sp. nov.**

*Candidatus* Brachybacterium intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID CHK130-7132 and which is available via NCBI BioSample SAMN15816812. This is a new name for the alphanumeric GTDB species sp003711805. The GC content of the type genome is 72.59% and the genome length is 3.5 Mbp.

**Description of *Candidatus Brachybacterium merdavium* sp. nov.**

*Candidatus* Brachybacterium merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird; N.L. gen. n. *merdavium* of bird faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiHjej13B12-24818 and which is available via NCBI BioSample SAMN15816666. The GC content of the type genome is 70.22% and the genome length is 3.7 Mbp.

**Description of *Candidatus Brachybacterium merdigallarum* sp. nov.**

*Candidatus* Brachybacterium merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiHjej13B12-7362 and which is available via NCBI BioSample SAMN15816717. The GC content of the type genome is 71.16% and the genome length is 3.1 Mbp.

1967 **Description of *Candidatus Brevibacterium intestinavium* sp. nov.**

1968 *Candidatus Brevibacterium intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
1969 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

1970

1971 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1972 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1973 assigned the MAG ID 5295 and which is available via NCBI BioSample SAMN15816668. The  
1974 GC content of the type genome is 66.76% and the genome length is 3.2 Mbp.

1975

1976

1977 **Description of *Candidatus Brevibacterium intestinigallarum* sp. nov.**

1978 *Candidatus Brevibacterium intestinigallarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
1979 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

1980

1981 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1982 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1983 assigned the MAG ID CHK132-2174 and which is available via NCBI BioSample  
1984 SAMN15816673. The GC content of the type genome is 70.54% and the genome length is 2.7  
1985 Mbp.

1986

1987

1988 **Description of *Candidatus Butyricoccus avicola* sp. nov.**

1989 *Candidatus Butyricoccus avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
1990 N.L. n. *avicola* inhabitant of birds)

1991

1992 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
1993 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
1994 assigned the MAG ID ChiSjej6B24-14740 and which is available via NCBI BioSample  
1995 SAMN15816587. The GC content of the type genome is 59.67% and the genome length is 2.0  
1996 Mbp.

1997

1998

1999 **Description of *Candidatus Butyricoccus avistercoris* sp. nov.**

2000 *Candidatus Butyricoccus avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
2001 dung; N.L. gen. n. *avistercoris* of bird faeces)

2002

2003 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2004 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2005 assigned the MAG ID CHK193-4272 and which is available via NCBI BioSample  
2006 SAMN15816626. The GC content of the type genome is 35.60% and the genome length is 2.0  
2007 Mbp.

2008

2009

2010 **Description of *Candidatus Butyricoccus stercorigallarum* sp. nov.**

2011 *Candidatus Butyricoccus stercorigallarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung;  
2012 L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallarum* of hen faeces)

2013

2014 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2015 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2016 assigned the MAG ID ChiHecec2B26-12929 and which is available via NCBI BioSample  
2017 SAMN15816912. Although GTDB has assigned this species to the genus it calls  
2018 *Butyricoccus\_A*, this genus designation cannot be incorporated into a well-formed binomial,  
2019 so in naming this species, we have used the current validly published name for the genus. The  
2020 GC content of the type genome is 62.06% and the genome length is 2.1 Mbp.

2021

2022

2023 **Description of *Candidatus Butyricimonas faecavium* sp. nov.**

2024 *Candidatus Butyricimonas faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
2025 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

2026

2027 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2028 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2029 assigned the MAG ID CHK27-1272 and which is available via NCBI BioSample  
2030 SAMN15816676. The GC content of the type genome is 40.60% and the genome length is 3.6  
2031 Mbp.

2032

2033

2034 **Description of *Candidatus Caccalectryoclostridium* gen. nov.**

2035 *Candidatus Caccalectryoclostridium* (Cacc.a.lec.try.o.clos.tri'di.um. Gr. fem. n. *kakke* faeces; Gr.  
2036 neut. n. *alektryon* chicken; N.L. neut. n. *Clostridium* a genus name; N.L. neut. n.

2037 *Caccalectryoclostridium* a genus related to the genus *Clostridium* but distinct from it and found  
2038 in poultry faeces)

2039

2040 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2041 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2042 species *Caccalectryoclostridium excrementigallinarum*. This genus has been assigned by GTDB-  
2043 Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
2044 order *Christensenellales* and to the family *UBA3700*.

2045

2046

2047 **Description of *Candidatus Caccalectryoclostridium excrementigallinarum* sp. nov.**

2048 *Candidatus Caccalectryoclostridium excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut.  
2049 n. *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
2050 excrement)

2051

2052 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2053 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2054 assigned the MAG ID 9366 and which is available via NCBI BioSample SAMN15816988. The  
2055 GC content of the type genome is 54.72% and the genome length is 1.5 Mbp.

2056

2057

2058 **Description of *Candidatus Caccenecus* gen. nov.**

2059 *Candidatus Caccenecus* (Caccen.e'cus. Gr. fem. n. *kakke* dung; Gr. masc. *enoikos* inhabitant;  
2060 N.L. masc. n. *Caccenecus* a microbe associated with faeces)

2061

2062 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2063 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2064 species *Caccenecus avistercoris*. This is a name for the alphanumeric GTDB genus CAG-776.  
2065 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2066 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-1000*.

2067

2068

2069 **Description of *Candidatus Caccenecus avistercoris* sp. nov.**

2070 *Candidatus Caccenecus avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
2071 N.L. gen. n. *avistercoris* of bird faeces)

2072

2073 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2074 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2075 assigned the MAG ID CHK193-13418 and which is available via NCBI BioSample  
2076 SAMN15817030. The GC content of the type genome is 28.47% and the genome length is 1.3  
2077 Mbp.

2078

2079

2080 **Description of *Candidatus Caccocola* gen. nov.**

2081 *Candidatus Caccocola* (Cacc.o.co'la. Gr. fem. n. *kakke* dung; L. suff. *-cola* inhabitant of; N.L.  
2082 fem. n. *Caccocola* a microbe associated with faeces)

2083

2084 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2085 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2086 species *Caccocola faecigallinarum*. This is a name for the alphanumeric GTDB genus An23.  
2087 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2088 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Synergistales* and to the family  
2089 *Synergistaceae*.

2090

2091

2092 **Description of *Candidatus Caccocola faecigallinarum* sp. nov.**

2093 *Candidatus Caccocola faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
2094 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

2095

2096 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2097 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2098 assigned the MAG ID ChiHjej11B10-3130 and which is available via NCBI BioSample  
2099 SAMN15817215. This is a new name for the alphanumeric GTDB species sp900544635. The  
2100 GC content of the type genome is 60.31% and the genome length is 2.3 Mbp.

2101

2102

2103 **Description of *Candidatus Caccocola faecipullorum* sp. nov.**

2104 *Candidatus* Caccocola faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
2105 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

2106  
2107 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2108 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2109 assigned the MAG ID ChiHcec3-7374 and which is available via NCBI BioSample  
2110 SAMN15817103. The GC content of the type genome is 59.08% and the genome length is 2.2  
2111 Mbp.

2112  
2113

2114 **Description of *Candidatus* Cacomonas gen. nov.**

2115 *Candidatus* Cacomonas (Cacc.omo'nas. Gr. fem. n. *kakke* dung; L. fem. n. *monas* a monad;  
2116 N.L. fem. n. *Cacomonas* a microbe associated with faeces)

2117

2118 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2119 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2120 species *Cacomonas pullistercoris*. This is a name for the alphanumeric GTDB genus CAG-617.  
2121 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2122 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family  
2123 *Bacteroidaceae*.

2124  
2125

2126 **Description of *Candidatus* Cacomonas pullistercoris sp. nov.**

2127 *Candidatus* Cacomonas pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
2128 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

2129

2130 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2131 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2132 assigned the MAG ID 5345 and which is available via NCBI BioSample SAMN15817152. The  
2133 GC content of the type genome is 59.45% and the genome length is 2.2 Mbp.

2134  
2135

2136 **Description of *Candidatus* Cacomorpha gen. nov.**

2137 *Candidatus* Cacomorpha (Cacc.o.mor'pha. Gr. fem. n. *kakke* dung; Gr. fem. n. *morphe* a form,  
2138 shape; N.L. fem. n. *Cacomorpha* a microbe associated with faeces)

2139

2140 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2141 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2142 species *Cacomorpha excrementavium*. This is a name for the alphanumeric GTDB genus  
2143 SZUA-448. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
2144 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
2145 *Lachnospiraceae*.

2146  
2147

2148 **Description of *Candidatus* Cacomorpha excrementavium sp. nov.**

2149 *Candidatus* Caccomorpha excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
2150 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

2151  
2152 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2153 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2154 assigned the MAG ID 1999 and which is available via NCBI BioSample SAMN15817145. The  
2155 GC content of the type genome is 50.75% and the genome length is 2.7 Mbp.

2156  
2157  
2158 **Description of *Candidatus* Caccoplasma gen. nov.**

2159 *Candidatus* Caccoplasma (Cacc.o.plas'ma. Gr. fem. n. *kakke* dung; Gr. neut. n. *plasma* a form;  
2160 N.L. neut. n. *Caccoplasma* a microbe associated with faeces)

2161  
2162 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2163 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2164 species *Caccoplasma merdavium*. This is a name for the alphanumeric GTDB genus UBA11471.  
2165 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2166 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family  
2167 *UBA11471*.

2168  
2169  
2170 **Description of *Candidatus* Caccoplasma intestinavium sp. nov.**

2171 *Candidatus* Caccoplasma intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
2172 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

2173  
2174 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2175 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2176 assigned the MAG ID 21143 and which is available via NCBI BioSample SAMN15817187. This  
2177 is a new name for the alphanumeric GTDB species sp000434215. The GC content of the type  
2178 genome is 45.83% and the genome length is 2.4 Mbp.

2179  
2180  
2181 **Description of *Candidatus* Caccoplasma merdavium sp. nov.**

2182 *Candidatus* Caccoplasma merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
2183 bird; N.L. gen. n. *merdavium* of bird faeces)

2184  
2185 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2186 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2187 assigned the MAG ID 6821 and which is available via NCBI BioSample SAMN15817190. This  
2188 is a new name for the alphanumeric GTDB species sp900542765. The GC content of the type  
2189 genome is 52.79% and the genome length is 2.4 Mbp.

2190  
2191  
2192 **Description of *Candidatus* Caccoplasma merdipullorum sp. nov.**

2193 *Candidatus* Caccoplasma merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
2194 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

2195

2196 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2197 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2198 assigned the MAG ID G3-4614 and which is available via NCBI BioSample SAMN15817135.  
2199 The GC content of the type genome is 46.70% and the genome length is 2.0 Mbp.

2200

2201

**Description of *Candidatus Caccopulliclostridium* gen. nov.**

2203 *Candidatus Caccopulliclostridium* (Cac.co.pul.li.clos.tri'di.um. Gr. fem. n. *kakke* faeces; L. masc.  
2204 n. *pullus* a young chicken; N.L. neut. n. *Clostridium* a genus name; N.L. neut. n.

2205 *Caccopulliclostridium* a genus related to the genus *Clostridium* but distinct from it and found in  
2206 poultry faeces)

2207

2208 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2209 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2210 species *Caccopulliclostridium gallistercoris*. This genus was identified but not named by  
2211 Glendinning et al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release  
2212 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *4C28d-15* and to the family  
2213 *UBA1242*.

2214

2215

**Description of *Candidatus Caccopulliclostridium gallistercoris* sp. nov.**

2217 *Candidatus Caccopulliclostridium gallistercoris* (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L.  
2218 neut. n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

2219

2220 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2221 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2222 assigned the MAG ID CHK186-9395 and which is available via NCBI BioSample  
2223 SAMN15816943. The GC content of the type genome is 35.40% and the genome length is 1.0  
2224 Mbp.

2225

2226

**Description of *Candidatus Caccosoma* gen. nov.**

2228 *Candidatus Caccosoma* (Cacc.o.so'ma. Gr. fem. n. *kakke* dung; Gr. neut. n. *soma* a body; N.L.  
2229 neut. n. *Caccosoma* a microbe associated with faeces)

2230

2231 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2232 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2233 species *Caccosoma faecigallinarum*. This is a name for the alphanumeric GTDB genus CAG-  
2234 631. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2235 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFN20* and to the family *CAG-631*.

2236

2237

**Description of *Candidatus Caccosoma faecigallinarum* sp. nov.**

2239 *Candidatus Caccosoma faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
2240 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

2241

2242 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2243 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2244 assigned the MAG ID 14508 and which is available via NCBI BioSample SAMN15817185. This  
2245 is a new name for the alphanumeric GTDB species sp000433015. The GC content of the type  
2246 genome is 30.38% and the genome length is 1.3 Mbp.

2247

2248

2249 **Description of *Candidatus Caccousia* gen. nov.**

2250 *Candidatus Caccousia* (Cacc.ou'si.a. Gr. fem. n. *kakke* dung; Gr. fem. n. *ousia* an essence; N.L.  
2251 fem. n. *Caccousia* a microbe associated with faeces)

2252

2253 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2254 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2255 species *Caccousia avicola*. This is a name for the alphanumeric GTDB genus An200. This genus  
2256 has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al.,  
2257 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Acutalibacteraceae*.

2258

2259

2260 **Description of *Candidatus Caccousia avicola* sp. nov.**

2261 *Candidatus Caccousia avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
2262 *avicola* inhabitant of birds)

2263

2264 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2265 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2266 assigned the MAG ID ChiSxjej1B13-7958 and which is available via NCBI BioSample  
2267 SAMN15817070. The GC content of the type genome is 58.28% and the genome length is 2.2  
2268 Mbp.

2269

2270

2271 **Description of *Candidatus Caccousia avistercoris* sp. nov.**

2272 *Candidatus Caccousia avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
2273 N.L. gen. n. *avistercoris* of bird faeces)

2274

2275 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2276 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2277 assigned the MAG ID 3024 and which is available via NCBI BioSample SAMN15817047. The  
2278 GC content of the type genome is 60.88% and the genome length is 2.6 Mbp.

2279

2280

2281 **Description of *Candidatus Caccousia stercoris* sp. nov.**

2282 *Candidatus Caccousia stercoris* (ster'co.ris. L. gen. n. *stercoris* of dung, excrement)

2283

2284 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2285 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2286 assigned the MAG ID 6086 and which is available via NCBI BioSample SAMN15817184. This

2287 is a new name for the alphanumeric GTDB species sp002160025. The GC content of the type  
2288 genome is 56.84% and the genome length is 2.3 Mbp.

2289  
2290

2291 **Description of *Candidatus Caccovicinus* gen. nov.**

2292 *Candidatus Caccovicinus* (Cacc.o.vic.in'us. Gr. fem. n. *kakke* dung; L. masc. n. *vicinus* a  
2293 neighbour; N.L. masc. n. *Caccovicinus* a microbe associated with faeces)

2294

2295 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2296 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2297 species *Caccovicinus merdipullorum*. This is a name for the alphanumeric GTDB genus  
2298 UMGS1370. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
2299 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
2300 *Lachnospiraceae*.

2301

2302

2303 **Description of *Candidatus Caccovicinus merdipullorum* sp. nov.**

2304 *Candidatus Caccovicinus merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
2305 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

2306

2307 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2308 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2309 assigned the MAG ID CHK198\_11255 and which is available via NCBI BioSample  
2310 SAMN15817041. The GC content of the type genome is 50.44% and the genome length is 3.0  
2311 Mbp.

2312

2313

2314 **Description of *Candidatus Caccovivens* gen. nov.**

2315 *Candidatus Caccovivens* (Cacc.o.viv'ens. Gr. fem. n. *kakke* dung; N.L. pres. part. *vivens* living;  
2316 N.L. fem. n. *Caccovivens* a microbe associated with faeces)

2317

2318 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2319 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2320 species *Caccovivens faecavium*. This is a name for the alphanumeric GTDB genus UBA11517.  
2321 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2322 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
2323 *UBA1242*.

2324

2325

2326 **Description of *Candidatus Caccovivens faecavium* sp. nov.**

2327 *Candidatus Caccovivens faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
2328 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

2329

2330 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2331 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2332 assigned the MAG ID ChiW6-1002 and which is available via NCBI BioSample

2333 SAMN15817119. The GC content of the type genome is 34.22% and the genome length is 1.1  
2334 Mbp.

2335

2336

2337 **Description of *Candidatus Cellulosilyticum pullistercoris* sp. nov.**

2338 *Candidatus Cellulosilyticum pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken;  
2339 L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

2340

2341 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2342 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2343 assigned the MAG ID B5-657 and which is available via NCBI BioSample SAMN15816752.

2344 The GC content of the type genome is 33.78% and the genome length is 2.3 Mbp.

2345

2346

2347 **Description of *Candidatus Choladocola* gen. nov.**

2348 *Candidatus Choladocola* (Cho.lad.o.co'la. Gr. fem. n. *cholae* guts; L. suff. *-cola* inhabitant of;  
2349 N.L. fem. n. *Choladocola* a microbe associated with the intestines)

2350

2351 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2352 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2353 species *Choladocola avistercoris*. This is a name for the alphanumeric GTDB genus UBA7182.

2354 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95

2355 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family

2356 *Lachnospiraceae*.

2357

2358

2359 **Description of *Candidatus Choladocola avistercoris* sp. nov.**

2360 *Candidatus Choladocola avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
2361 dung; N.L. gen. n. *avistercoris* of bird faeces)

2362

2363 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2364 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2365 assigned the MAG ID ChiBcec18-1958 and which is available via NCBI BioSample

2366 SAMN15817180. This is a new name for the alphanumeric GTDB species sp002160135. The

2367 GC content of the type genome is 50.79% and the genome length is 2.4 Mbp.

2368

2369

2370 **Description of *Candidatus Choladousia* gen. nov.**

2371 *Candidatus Choladousia* (Cho.lad.ou'si.a. Gr. fem. n. *cholae* guts; Gr. fem. n. *ousia* an essence;  
2372 N.L. fem. n. *Choladousia* a microbe associated with the intestines)

2373

2374 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2375 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2376 species *Choladousia intestinavium*. This is a name for the alphanumeric GTDB genus UBA7160.

2377 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95

2378 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
2379 *Lachnospiraceae*.

2380

2381

2382 **Description of *Candidatus Choladousia intestinavium* sp. nov.**

2383 *Candidatus* Choladousia intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
2384 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

2385

2386 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2387 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2388 assigned the MAG ID ChiSjej4B22-8148 and which is available via NCBI BioSample  
2389 SAMN15817012. The GC content of the type genome is 49.57% and the genome length is 2.9  
2390 Mbp.

2391

2392

2393 **Description of *Candidatus Choladousia intestinigallarum* sp. nov.**

2394 *Candidatus* Choladousia intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
2395 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

2396

2397 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2398 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2399 assigned the MAG ID ChiBcec11-13528 and which is available via NCBI BioSample  
2400 SAMN15817065. The GC content of the type genome is 48.69% and the genome length is 3.1  
2401 Mbp.

2402

2403

2404 **Description of *Candidatus Choladousia intestinipullorum* sp. nov.**

2405 *Candidatus* Choladousia intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
2406 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

2407

2408 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2409 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2410 assigned the MAG ID ChiSjej5B23-16397 and which is available via NCBI BioSample  
2411 SAMN15817078. The GC content of the type genome is 50.54% and the genome length is 2.2  
2412 Mbp.

2413

2414

2415 **Description of *Candidatus Collinsella stercoripullorum* sp. nov.**

2416 *Candidatus* Collinsella stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
2417 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

2418

2419 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2420 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2421 assigned the MAG ID ChiGjej6B6-20822 and which is available via NCBI BioSample  
2422 SAMN15816681. The GC content of the type genome is 68.61% and the genome length is 2.3  
2423 Mbp.

2424

2425

**2426 Description of *Candidatus Companilactobacillus pullicola* sp. nov.**

2427 *Candidatus* Companilactobacillus pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L.  
2428 suff. *-cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

2429

2430 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2431 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2432 assigned the MAG ID 3204 and which is available via NCBI BioSample SAMN15816700. The  
2433 GC content of the type genome is 35.87% and the genome length is 2.9 Mbp.

2434

2435

**2436 Description of *Candidatus Coprenecus* gen. nov.**

2437 *Candidatus* Coprenecus (Copr.en.e'cus. Gr. fem. n. *kopros* dung; Gr. masc. *enoikos* inhabitant;  
2438 N.L. masc. n. *Coprenecus* a microbe associated with faeces)

2439

2440 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2441 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2442 species *Coprenecus pullicola*. This is a name for the alphanumeric GTDB genus CAG-831. This  
2443 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
2444 al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family *UBA932*.

2445

2446

**2447 Description of *Candidatus Coprenecus avistercoris* sp. nov.**

2448 *Candidatus* Coprenecus avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
2449 N.L. gen. n. *avistercoris* of bird faeces)

2450

2451 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2452 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2453 assigned the MAG ID ChiHjej13B12-12457 and which is available via NCBI BioSample  
2454 SAMN15817175. This is a new name for the alphanumeric GTDB species sp000432775. The  
2455 GC content of the type genome is 56.44% and the genome length is 2.0 Mbp.

2456

2457

**2458 Description of *Candidatus Coprenecus merdigallarum* sp. nov.**

2459 *Candidatus* Coprenecus merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
2460 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

2461

2462 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2463 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2464 assigned the MAG ID ChiHecolR1B25-18470 and which is available via NCBI BioSample  
2465 SAMN15817066. The GC content of the type genome is 55.94% and the genome length is 2.2  
2466 Mbp.

2467

2468

**2469 Description of *Candidatus Coprenecus merdipullorum* sp. nov.**

2470 *Candidatus Coprenecus merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
2471 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

2472  
2473 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2474 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2475 assigned the MAG ID Gambia11-1358 and which is available via NCBI BioSample  
2476 SAMN15817068. The GC content of the type genome is 54.29% and the genome length is 2.1  
2477 Mbp.

2478  
2479

2480 **Description of *Candidatus Coprenecus pullicola* sp. nov.**

2481 *Candidatus Coprenecus pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
2482 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

2483

2484 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2485 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2486 assigned the MAG ID ChiHjej9B8-15444 and which is available via NCBI BioSample  
2487 SAMN15817077. The GC content of the type genome is 52.53% and the genome length is 2.1  
2488 Mbp.

2489  
2490

2491 **Description of *Candidatus Coprenecus pullistercoris* sp. nov.**

2492 *Candidatus Coprenecus pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
2493 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

2494

2495 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2496 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2497 assigned the MAG ID Gambia18-42 and which is available via NCBI BioSample  
2498 SAMN15817084. The GC content of the type genome is 52.64% and the genome length is 2.0  
2499 Mbp.

2500  
2501

2502 **Description of *Candidatus Coprenecus stercoravium* sp. nov.**

2503 *Candidatus Coprenecus stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
2504 bird; N.L. gen. n. *stercoravium* of bird faeces)

2505

2506 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2507 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2508 assigned the MAG ID Gambia16-554 and which is available via NCBI BioSample  
2509 SAMN15817085. The GC content of the type genome is 51.84% and the genome length is 1.8  
2510 Mbp.

2511  
2512

2513 **Description of *Candidatus Coprenecus stercorigallinarum* sp. nov.**

2514 *Candidatus Coprenecus stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
2515 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

2516

2517 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2518 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2519 assigned the MAG ID 3382 and which is available via NCBI BioSample SAMN15817086. The  
2520 GC content of the type genome is 53.66% and the genome length is 2.1 Mbp.

2521

2522

**Description of *Candidatus Coprenecus stercoripullorum* sp. nov.**

2524 *Candidatus* Coprenecus stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
2525 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

2526

2527 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2528 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2529 assigned the MAG ID 7141 and which is available via NCBI BioSample SAMN15817115. The  
2530 GC content of the type genome is 50.92% and the genome length is 1.7 Mbp.

2531

2532

**Description of *Candidatus Coprocola* gen. nov.**

2534 *Candidatus* Coprocola (Copr.o.co'la. Gr. fem. n. *kopros* dung; L. suff. *-cola* inhabitant of; N.L.  
2535 fem. n. *Coprocola* a microbe associated with faeces)

2536

2537 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2538 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2539 species *Coprocola pullicola*. This is a name for the alphanumeric GTDB genus ASF356. This  
2540 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
2541 al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family *Anaerotignaceae*.

2542

2543

**Description of *Candidatus Coprocola pullicola* sp. nov.**

2545 *Candidatus* Coprocola pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
2546 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

2547

2548 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2549 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2550 assigned the MAG ID CHK193-15662 and which is available via NCBI BioSample  
2551 SAMN15817043. The GC content of the type genome is 33.91% and the genome length is 3.0  
2552 Mbp.

2553

2554

**Description of *Candidatus Copromonas* gen. nov.**

2556 *Candidatus* Copromonas (Copr.omo'nas. Gr. fem. n. *kopros* dung; L. fem. n. *monas* a monad;  
2557 N.L. fem. n. *Copromonas* a microbe associated with faeces)

2558

2559 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2560 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2561 species *Copromonas avistercoris*. This is a name for the alphanumeric GTDB genus CAG-81.

2562 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2563 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
2564 *Lachnospiraceae*.

2565  
2566

2567 **Description of *Candidatus Copromonas avistercoris* sp. nov.**

2568 *Candidatus* Copromonas avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
2569 dung; N.L. gen. n. *avistercoris* of bird faeces)

2570

2571 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2572 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2573 assigned the MAG ID ChiSje3B21-5768 and which is available via NCBI BioSample  
2574 SAMN15817005. The GC content of the type genome is 52.88% and the genome length is 2.2  
2575 Mbp.

2576

2577

2578 **Description of *Candidatus Copromonas faecavium* sp. nov.**

2579 *Candidatus* Copromonas faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
2580 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

2581

2582 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2583 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2584 assigned the MAG ID CHK180-2868 and which is available via NCBI BioSample  
2585 SAMN15817009. The GC content of the type genome is 50.20% and the genome length is 2.7  
2586 Mbp.

2587

2588

2589 **Description of *Candidatus Copromorpha* gen. nov.**

2590 *Candidatus* Copromorpha (Copr.o.mor'pha. Gr. fem. n. *kopros* dung; Gr. fem. n. *morphe* a form,  
2591 shape; N.L. fem. n. *Copromorpha* a microbe associated with faeces)

2592

2593 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2594 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2595 species *Copromorpha excrementavium*. This is a name for the alphanumeric GTDB genus  
2596 UBA1191. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
2597 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Peptostreptococcales* and to the  
2598 family *Anaerovoracaceae*.

2599

2600

2601 **Description of *Candidatus Copromorpha excrementavium* sp. nov.**

2602 *Candidatus* Copromorpha excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
2603 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

2604

2605 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2606 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2607 assigned the MAG ID CHK176-22527 and which is available via NCBI BioSample

2608 SAMN15817193. This is a new name for the alphanumeric GTDB species sp900542385. The  
2609 GC content of the type genome is 42.88% and the genome length is 1.8 Mbp.

2610  
2611

2612 **Description of *Candidatus Copromorpha excrementigallinarum* sp. nov.**

2613 *Candidatus* Copromorpha excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
2614 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
2615 excrement)

2616

2617 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2618 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2619 assigned the MAG ID ChiHcec3-6078 and which is available via NCBI BioSample  
2620 SAMN15817131. The GC content of the type genome is 48.15% and the genome length is 2.0  
2621 Mbp.

2622

2623

2624 **Description of *Candidatus Copromorpha excrementipullorum* sp. nov.**

2625 *Candidatus* Copromorpha excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
2626 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
2627 young chicken excrement)

2628

2629 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2630 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2631 assigned the MAG ID ChiSjej4B22-8349 and which is available via NCBI BioSample  
2632 SAMN15817205. This is a new name for the alphanumeric GTDB species sp900543485. The  
2633 GC content of the type genome is 49.77% and the genome length is 1.9 Mbp.

2634

2635

2636 **Description of *Candidatus Coproplasma* gen. nov.**

2637 *Candidatus* Coproplasma (Copr.o.plas'ma. Gr. fem. n. *kopros* dung; Gr. neut. n. *plasma* a form;  
2638 N.L. neut. n. *Coproplasma* a microbe associated with faeces)

2639

2640 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2641 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2642 species *Coproplasma stercoravium*. This is a name for the alphanumeric GTDB genus  
2643 UBA11940. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
2644 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
2645 *Borkfalkiaceae*.

2646

2647

2648 **Description of *Candidatus Coproplasma avicola* sp. nov.**

2649 *Candidatus* Coproplasma avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
2650 N.L. n. *avicola* inhabitant of birds)

2651

2652 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2653 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

2654 assigned the MAG ID ChiW16-3235 and which is available via NCBI BioSample  
2655 SAMN15817075. The GC content of the type genome is 51.11% and the genome length is 1.5  
2656 Mbp.

2657  
2658

2659 **Description of *Candidatus Coproplasma avistercoris* sp. nov.**

2660 *Candidatus* Coproplasma avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
2661 dung; N.L. gen. n. *avistercoris* of bird faeces)

2662

2663 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2664 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2665 assigned the MAG ID ChiW7-3743 and which is available via NCBI BioSample  
2666 SAMN15817023. The GC content of the type genome is 56.32% and the genome length is 1.4  
2667 Mbp.

2668

2669

2670 **Description of *Candidatus Coproplasma excrementavium* sp. nov.**

2671 *Candidatus* Coproplasma excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
2672 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

2673

2674 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2675 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2676 assigned the MAG ID CHK179-18245 and which is available via NCBI BioSample  
2677 SAMN15817045. The GC content of the type genome is 50.26% and the genome length is 1.4  
2678 Mbp.

2679

2680

2681 **Description of *Candidatus Coproplasma excrementigallarum* sp. nov.**

2682 *Candidatus* Coproplasma excrementigallarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
2683 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
2684 excrement)

2685

2686 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2687 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2688 assigned the MAG ID CHK195-12923 and which is available via NCBI BioSample  
2689 SAMN15817050. The GC content of the type genome is 50.00% and the genome length is 1.4  
2690 Mbp.

2691

2692

2693 **Description of *Candidatus Coproplasma excrementipullorum* sp. nov.**

2694 *Candidatus* Coproplasma excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
2695 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
2696 chicken excrement)

2697

2698 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2699 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

2700 assigned the MAG ID 10570 and which is available via NCBI BioSample SAMN15817148. The  
2701 GC content of the type genome is 51.24% and the genome length is 1.7 Mbp.

2702

2703

2704 **Description of *Candidatus Coproplasma stercoravium* sp. nov.**

2705 *Candidatus* Coproplasma stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
2706 bird; N.L. gen. n. *stercoravium* of bird faeces)

2707

2708 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2709 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2710 assigned the MAG ID CHK180-19203 and which is available via NCBI BioSample  
2711 SAMN15817006. The GC content of the type genome is 51.86% and the genome length is 1.6  
2712 Mbp.

2713

2714

2715 **Description of *Candidatus Coproplasma stercorigallinarum* sp. nov.**

2716 *Candidatus* Coproplasma stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
2717 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

2718

2719 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2720 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2721 assigned the MAG ID CHK191-24566 and which is available via NCBI BioSample  
2722 SAMN15817171. This is a new name for the alphanumeric GTDB species sp900549005. The  
2723 GC content of the type genome is 51.83% and the genome length is 1.6 Mbp.

2724

2725

2726 **Description of *Candidatus Coproplasma stercoripullorum* sp. nov.**

2727 *Candidatus* Coproplasma stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
2728 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

2729

2730 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2731 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2732 assigned the MAG ID ChiW25-3613 and which is available via NCBI BioSample  
2733 SAMN15817071. The GC content of the type genome is 51.17% and the genome length is 1.7  
2734 Mbp.

2735

2736

2737 **Description of *Candidatus Coprosoma* gen. nov.**

2738 *Candidatus* Coprosoma (Copr.o.so'ma. Gr. fem. n. *kopros* dung; Gr. neut. n. *soma* a body; N.L.  
2739 neut. n. *Coprosoma* a microbe associated with faeces)

2740

2741 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2742 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2743 species *Coprosoma intestinipullorum*. This is a name for the alphanumeric GTDB genus CAG-  
2744 822. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
2745 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-822*.

2746

2747

**2748 Description of *Candidatus Coprosoma intestinipullorum* sp. nov.**2749 *Candidatus* Coprosoma intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.2750 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

2751

2752 A bacterial species identified by metagenomic analyses. This species includes all bacteria with

2753 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

2754 assigned the MAG ID CHK147-3167 and which is available via NCBI BioSample

2755 SAMN15817008. The GC content of the type genome is 31.20% and the genome length is 1.3

2756 Mbp.

2757

2758

**2759 Description of *Candidatus Coprousia* gen. nov.**2760 *Candidatus* Coprousia (Copr.ou'si.a. Gr. fem. n. *kopros* dung; Gr. fem. n. *ousia* an essence; N.L.2761 fem. n. *Coprousia* a microbe associated with faeces)

2762

2763 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with

2764 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type2765 species *Coprousia avicola*. This is a name for the alphanumeric GTDB genus An7. This genus

2766 has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al.,

2767 2019; Parks et al., 2020) to the order *Coriobacteriales* and to the family *Coriobacteriaceae*.

2768

2769

**2770 Description of *Candidatus Coprousia avicola* sp. nov.**2771 *Candidatus* Coprousia avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.2772 *avicola* inhabitant of birds)

2773

2774 A bacterial species identified by metagenomic analyses. This species includes all bacteria with

2775 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

2776 assigned the MAG ID ChiHjej11B10-5566 and which is available via NCBI BioSample

2777 SAMN15817195. This is a new name for the alphanumeric GTDB species sp002159765. The

2778 GC content of the type genome is 65.47% and the genome length is 2.4 Mbp.

2779

2780

**2781 Description of *Candidatus Coprovicinus* gen. nov.**2782 *Candidatus* Coprovicinus (Copr.o.vic.in'us. Gr. fem. n. *kopros* dung; L. masc. n. *vicinus* a2783 neighbour; N.L. masc. n. *Coprovicinus* a microbe associated with faeces)

2784

2785 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with

2786 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type2787 species *Coprovicinus avistercoris*. This is a name for the alphanumeric GTDB genus

2788 UMGS1418. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-

2789 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Coriobacteriales* and to the family2790 *Atopobiaceae*.

2791

2792

**2793 Description of *Candidatus Coprovicinus avistercoris* sp. nov.**

2794 *Candidatus Coprovicinus avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
2795 dung; N.L. gen. n. *avistercoris* of bird faeces)

2796

2797 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2798 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2799 assigned the MAG ID ChiHjej12B11-29160 and which is available via NCBI BioSample  
2800 SAMN15817198. This is a new name for the alphanumeric GTDB species sp900551595. The  
2801 GC content of the type genome is 49.51% and the genome length is 1.7 Mbp.

2802

2803

**2804 Description of *Candidatus Coprovivens* gen. nov.**

2805 *Candidatus Coprovivens* (Copr.o.viv'ens. Gr. fem. n. *kopros* dung; N.L. pres. part. *vivens* living;  
2806 N.L. fem. n. *Coprovivens* a microbe associated with faeces)

2807

2808 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2809 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2810 species *Coprovivens excrementavium*. This is a name for the alphanumeric GTDB genus  
2811 UBA11963. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
2812 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-1000*.

2813

2814

**2815 Description of *Candidatus Coprovivens excrementavium* sp. nov.**

2816 *Candidatus Coprovivens excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
2817 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

2818

2819 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2820 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2821 assigned the MAG ID 3297 and which is available via NCBI BioSample SAMN15817083. The  
2822 GC content of the type genome is 28.25% and the genome length is 2.2 Mbp.

2823

2824

**2825 Description of *Candidatus Corynebacterium avicola* sp. nov.**

2826 *Candidatus Corynebacterium avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
2827 N.L. n. *avicola* inhabitant of birds)

2828

2829 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2830 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2831 assigned the MAG ID CHK32-1732 and which is available via NCBI BioSample  
2832 SAMN15816750. The GC content of the type genome is 66.95% and the genome length is 3.1  
2833 Mbp.

2834

2835

**2836 Description of *Candidatus Corynebacterium faecigallinarum* sp. nov.**

2837 *Candidatus* Corynebacterium faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
2838 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

2839

2840 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2841 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2842 assigned the MAG ID ChiHjej13B12-4958 and which is available via NCBI BioSample  
2843 SAMN15816631. The GC content of the type genome is 66.91% and the genome length is 2.8  
2844 Mbp.

2845

2846

2847 **Description of *Candidatus* Corynebacterium faecipullorum sp. nov.**

2848 *Candidatus* Corynebacterium faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement;  
2849 L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

2850

2851 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2852 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2853 assigned the MAG ID 913 and which is available via NCBI BioSample SAMN15816858. This is  
2854 a new name for the alphanumeric GTDB species sp001836165. The GC content of the type  
2855 genome is 61.16% and the genome length is 2.1 Mbp.

2856

2857

2858 **Description of *Candidatus* Corynebacterium gallistercoris sp. nov.**

2859 *Candidatus* Corynebacterium gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut.  
2860 n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

2861

2862 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2863 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2864 assigned the MAG ID 4376 and which is available via NCBI BioSample SAMN15816747. The  
2865 GC content of the type genome is 62.96% and the genome length is 2.0 Mbp.

2866

2867

2868 **Description of *Candidatus* Corynebacterium intestinavium sp. nov.**

2869 *Candidatus* Corynebacterium intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem.  
2870 n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

2871

2872 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2873 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2874 assigned the MAG ID 5925 and which is available via NCBI BioSample SAMN15816787. The  
2875 GC content of the type genome is 65.59% and the genome length is 1.9 Mbp.

2876

2877

2878 **Description of *Candidatus* Cottocaccamicrobium gen. nov.**

2879 *Candidatus* Cottocaccamicrobium (Cot.to.cac.co.mi.cro'bi.um. Gr. masc. n. *kottos* chicken; Gr.  
2880 fem. n. *kakke* faeces; N.L. neut. n. *microbium* a microbe; N.L. neut. n. *Cottocaccamicrobium* a  
2881 microbe associated with chicken faeces)

2882

2883 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2884 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2885 species *Cottocaccamicrobium excrementipullorum*. This genus was identified but not named by  
2886 Glendinning et al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release  
2887 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
2888 *Lachnospiraceae*.

2889  
2890

2891 **Description of *Candidatus Cottocaccamicrobium excrementipullorum* sp. nov.**

2892 *Candidatus* Cottocaccamicrobium excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
2893 excrementum excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
2894 young chicken excrement)

2895

2896 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2897 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2898 assigned the MAG ID CHK179-5732 and which is available via NCBI BioSample  
2899 SAMN15816932. The GC content of the type genome is 47.54% and the genome length is 3.4  
2900 Mbp.

2901

2902

2903 **Description of *Candidatus Cryptobacteroides* gen. nov.**

2904 *Candidatus* Cryptobacteroides (Cryp.to.bac.te.ro'i.des. Gr. masc. adj. *kryptos* hidden; N.L. masc.  
2905 n. *Bacteroides* a genus name; N.L. masc. n. *Cryptobacteroides* a genus related to the genus  
2906 *Bacteroides* but distinct from it)

2907

2908 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
2909 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
2910 species *Cryptobacteroides avicola*. This is a name for the alphanumeric GTDB genus RC9. This  
2911 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
2912 al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family *UBA932*.

2913

2914

2915 **Description of *Candidatus Cryptobacteroides avicola* sp. nov.**

2916 *Candidatus* Cryptobacteroides avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
2917 N.L. n. *avicola* inhabitant of birds)

2918

2919 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2920 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2921 assigned the MAG ID G3-8215 and which is available via NCBI BioSample SAMN15817056.  
2922 The GC content of the type genome is 49.81% and the genome length is 2.6 Mbp.

2923

2924

2925 **Description of *Candidatus Cryptobacteroides avistercoris* sp. nov.**

2926 *Candidatus* Cryptobacteroides avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n.  
2927 *stercus* dung; N.L. gen. n. *avistercoris* of bird faeces)

2928

2929 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2930 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2931 assigned the MAG ID B3-1481 and which is available via NCBI BioSample SAMN15817057.  
2932 The GC content of the type genome is 59.28% and the genome length is 1.6 Mbp.

2933  
2934

2935 **Description of *Candidatus Cryptobacteroides excrementavium* sp. nov.**

2936 *Candidatus* Cryptobacteroides excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
2937 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

2938

2939 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2940 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2941 assigned the MAG ID B2-16538 and which is available via NCBI BioSample SAMN15817059.  
2942 The GC content of the type genome is 50.29% and the genome length is 2.1 Mbp.

2943  
2944

2945 **Description of *Candidatus Cryptobacteroides excrementigallarum* sp. nov.**

2946 *Candidatus* Cryptobacteroides excrementigallarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
2947 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
2948 excrement)

2949

2950 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2951 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2952 assigned the MAG ID ChiHecolR1B25-7735 and which is available via NCBI BioSample  
2953 SAMN15817167. This is a new name for the alphanumeric GTDB species sp900543205. The  
2954 GC content of the type genome is 57.80% and the genome length is 1.8 Mbp.

2955  
2956

2957 **Description of *Candidatus Cryptobacteroides excrementipullorum* sp. nov.**

2958 *Candidatus* Cryptobacteroides excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
2959 *excrementum* excrement; L. masc. gen.pl. n. *pullorum* of young chickens; N.L. gen. n.  
2960 *excrementipullorum* of young chicken excrement)

2961

2962 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2963 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2964 assigned the MAG ID 2478 and which is available via NCBI BioSample SAMN15817061. The  
2965 GC content of the type genome is 52.35% and the genome length is 2.5 Mbp.

2966  
2967

2968 **Description of *Candidatus Cryptobacteroides faecavium* sp. nov.**

2969 *Candidatus* Cryptobacteroides faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L.  
2970 fem. n. *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

2971

2972 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2973 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

2974 assigned the MAG ID B2-22910 and which is available via NCBI BioSample SAMN15817063.  
2975 The GC content of the type genome is 52.41% and the genome length is 2.4 Mbp.

2976

2977

2978 **Description of *Candidatus Cryptobacteroides faecigallinarum* sp. nov.**

2979 *Candidatus* Cryptobacteroides faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
2980 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

2981

2982 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2983 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2984 assigned the MAG ID B1-13419 and which is available via NCBI BioSample SAMN15817072.

2985 The GC content of the type genome is 49.87% and the genome length is 2.0 Mbp.

2986

2987

2988 **Description of *Candidatus Cryptobacteroides faecipullorum* sp. nov.**

2989 *Candidatus* Cryptobacteroides faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis*  
2990 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
2991 faeces)

2992

2993 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
2994 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
2995 assigned the MAG ID B1-15692 and which is available via NCBI BioSample SAMN15817080.

2996 The GC content of the type genome is 49.55% and the genome length is 2.3 Mbp.

2997

2998

2999 **Description of *Candidatus Cryptobacteroides gallistercoris* sp. nov.**

3000 *Candidatus* Cryptobacteroides gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut.  
3001 n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

3002

3003 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3004 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3005 assigned the MAG ID F1-3629 and which is available via NCBI BioSample SAMN15817088.

3006 The GC content of the type genome is 51.79% and the genome length is 2.0 Mbp.

3007

3008

3009 **Description of *Candidatus Cryptobacteroides intestinavium* sp. nov.**

3010 *Candidatus* Cryptobacteroides intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L.  
3011 fem. n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

3012

3013 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3014 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3015 assigned the MAG ID B1-20833 and which is available via NCBI BioSample SAMN15817087.

3016 The GC content of the type genome is 51.51% and the genome length is 2.4 Mbp.

3017

3018

3019 **Description of *Candidatus Cryptobacteroides intestinigallinarum* sp. nov.**

3020 *Candidatus* Cryptobacteroides intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
3021 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

3022  
3023 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3024 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3025 assigned the MAG ID B1-3475 and which is available via NCBI BioSample SAMN15817089.  
3026 The GC content of the type genome is 49.55% and the genome length is 2.3 Mbp.

3027  
3028

3029 **Description of *Candidatus* Cryptobacteroides intestinipullorum sp. nov.**

3030 *Candidatus* Cryptobacteroides intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum*  
3031 gut; L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young  
3032 chickens)

3033

3034 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3035 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3036 assigned the MAG ID 33258 and which is available via NCBI BioSample SAMN15817090. The  
3037 GC content of the type genome is 50.60% and the genome length is 2.4 Mbp.

3038  
3039

3040 **Description of *Candidatus* Cryptobacteroides merdavium sp. nov.**

3041 *Candidatus* Cryptobacteroides merdavium (mer.d.a'vi.um. L. fem. n. *merda* faeces; L. fem. n.  
3042 *avis* bird; N.L. gen. n. *merdavium* of bird faeces)

3043

3044 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3045 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3046 assigned the MAG ID D5-748 and which is available via NCBI BioSample SAMN15817104.  
3047 The GC content of the type genome is 50.98% and the genome length is 2.5 Mbp.

3048  
3049

3050 **Description of *Candidatus* Cryptobacteroides merdigallarum sp. nov.**

3051 *Candidatus* Cryptobacteroides merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
3052 fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

3053

3054 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3055 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3056 assigned the MAG ID 20514 and which is available via NCBI BioSample SAMN15817110. The  
3057 GC content of the type genome is 54.69% and the genome length is 2.3 Mbp.

3058  
3059

3060 **Description of *Candidatus* Cryptobacteroides merdipullorum sp. nov.**

3061 *Candidatus* Cryptobacteroides merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L.  
3062 masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

3063

3064 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3065 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3066 assigned the MAG ID ChiHecec2B26-709 and which is available via NCBI BioSample  
3067 SAMN15817116. The GC content of the type genome is 57.16% and the genome length is 2.0  
3068 Mbp.

3069  
3070

3071 **Description of *Candidatus Cryptobacteroides pullicola* sp. nov.**

3072 *Candidatus* Cryptobacteroides pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff.  
3073 *-cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

3074

3075 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3076 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3077 assigned the MAG ID ChiHecec2B26-3624 and which is available via NCBI BioSample  
3078 SAMN15817179. This is a new name for the alphanumeric GTDB species sp001915575. The  
3079 GC content of the type genome is 58.01% and the genome length is 1.7 Mbp.

3080

3081

3082 **Description of *Candidatus Desulfovibrio faecigallinarum* sp. nov.**

3083 *Candidatus* Desulfovibrio faecigallinarum (fae.ci.gal.li.na'rūm. L. fem. n. *faex*, *faecis* excrement;  
3084 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

3085

3086 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3087 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3088 assigned the MAG ID 8923 and which is available via NCBI BioSample SAMN15816873. This  
3089 is a new name for the alphanumeric GTDB species sp002159665. The GC content of the type  
3090 genome is 57.29% and the genome length is 2.0 Mbp.

3091

3092

3093 **Description of *Candidatus Desulfovibrio gallistercoris* sp. nov.**

3094 *Candidatus* Desulfovibrio gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
3095 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

3096

3097 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3098 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3099 assigned the MAG ID ChiGjej2B2-32749 and which is available via NCBI BioSample  
3100 SAMN15816654. The GC content of the type genome is 64.54% and the genome length is 2.8  
3101 Mbp.

3102

3103

3104 **Description of *Candidatus Desulfovibrio intestinavium* sp. nov.**

3105 *Candidatus* Desulfovibrio intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
3106 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

3107

3108 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3109 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3110 assigned the MAG ID 5032 and which is available via NCBI BioSample SAMN15816664. The  
3111 GC content of the type genome is 64.60% and the genome length is 2.5 Mbp.

3112

3113

3114 **Description of *Candidatus Desulfovibrio intestinigallinarum* sp. nov.**

3115 *Candidatus* Desulfovibrio intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;

3116 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

3117

3118 A bacterial species identified by metagenomic analyses. This species includes all bacteria with

3119 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3120 assigned the MAG ID ChiHecec3B27-2601 and which is available via NCBI BioSample

3121 SAMN15816737. The GC content of the type genome is 61.03% and the genome length is 2.9

3122 Mbp.

3123

3124

3125 **Description of *Candidatus Desulfovibrio intestinipullorum* sp. nov.**

3126 *Candidatus* Desulfovibrio intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.

3127 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

3128

3129 A bacterial species identified by metagenomic analyses. This species includes all bacteria with

3130 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3131 assigned the MAG ID ChiHecec2B26-446 and which is available via NCBI BioSample

3132 SAMN15816774. The GC content of the type genome is 60.23% and the genome length is 2.8

3133 Mbp.

3134

3135

3136 **Description of *Candidatus Dietzia intestinigallinarum* sp. nov.**

3137 *Candidatus* Dietzia intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.

3138 fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

3139

3140 A bacterial species identified by metagenomic analyses. This species includes all bacteria with

3141 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3142 assigned the MAG ID ChiHjej12B11-1528 and which is available via NCBI BioSample

3143 SAMN15816635. The GC content of the type genome is 69.86% and the genome length is 3.9

3144 Mbp.

3145

3146

3147 **Description of *Candidatus Dietzia intestinipullorum* sp. nov.**

3148 *Candidatus* Dietzia intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L. masc.

3149 n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

3150

3151 A bacterial species identified by metagenomic analyses. This species includes all bacteria with

3152 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3153 assigned the MAG ID ChiHjej13B12-8321 and which is available via NCBI BioSample

3154 SAMN15816639. The GC content of the type genome is 71.26% and the genome length is 3.0

3155 Mbp.

3156

3157

3158 **Description of *Candidatus Dietzia merdigallarum* sp. nov.**

3159 *Candidatus* Dietzia merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n.  
3160 *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

3161

3162 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3163 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3164 assigned the MAG ID ChiHjej8B7-16427 and which is available via NCBI BioSample  
3165 SAMN15816758. The GC content of the type genome is 68.76% and the genome length is 3.6  
3166 Mbp.

3167

3168

3169 **Description of *Candidatus Dorea faecigallarum* sp. nov.**

3170 *Candidatus* Dorea faecigallarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
3171 n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

3172

3173 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3174 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3175 assigned the MAG ID ChiHjej12B11-29902 and which is available via NCBI BioSample  
3176 SAMN15816646. The GC content of the type genome is 50.13% and the genome length is 2.0  
3177 Mbp.

3178

3179

3180 **Description of *Candidatus Dorea faecipullorum* sp. nov.**

3181 *Candidatus* Dorea faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L. masc. n.  
3182 *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

3183

3184 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3185 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3186 assigned the MAG ID ChiGjej2B2-10896 and which is available via NCBI BioSample  
3187 SAMN15816847. This is a new name for the alphanumeric GTDB species sp900543315. The  
3188 GC content of the type genome is 45.40% and the genome length is 2.3 Mbp.

3189

3190

3191 **Description of *Candidatus Dorea gallistercoris* sp. nov.**

3192 *Candidatus* Dorea gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n. *stercus*  
3193 dung; N.L. gen. n. *gallistercoris* of chicken faeces)

3194

3195 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3196 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3197 assigned the MAG ID ChiSxjej1B13-11762 and which is available via NCBI BioSample  
3198 SAMN15816753. The GC content of the type genome is 51.71% and the genome length is 2.2  
3199 Mbp.

3200

3201

3202 **Description of *Candidatus Dorea intestinavium* sp. nov.**

3203 *Candidatus* Dorea intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n. *avis*  
3204 bird; N.L. gen. n. *intestinavium* of the gut of birds)

3205  
3206 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3207 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3208 assigned the MAG ID CHK160-14747 and which is available via NCBI BioSample  
3209 SAMN15816767. The GC content of the type genome is 35.91% and the genome length is 1.9  
3210 Mbp.

3211

3212

3213 **Description of *Candidatus* Dorea intestinigallarum sp. nov.**

3214 *Candidatus* Dorea intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L. fem.  
3215 n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

3216

3217 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3218 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3219 assigned the MAG ID CHK188-17839 and which is available via NCBI BioSample  
3220 SAMN15816854. This is a new name for the alphanumeric GTDB species sp000765215. The  
3221 GC content of the type genome is 54.58% and the genome length is 2.5 Mbp.

3222

3223

3224 **Description of *Candidatus* Dorea merdavium sp. nov.**

3225 *Candidatus* Dorea merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird; N.L.  
3226 gen. n. *merdavium* of bird faeces)

3227

3228 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3229 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3230 assigned the MAG ID ChiSxjej1B13-1060 and which is available via NCBI BioSample  
3231 SAMN15816851. This is a new name for the alphanumeric GTDB species sp900312975. The  
3232 GC content of the type genome is 53.23% and the genome length is 2.0 Mbp.

3233

3234

3235 **Description of *Candidatus* Dorea stercoravium sp. nov.**

3236 *Candidatus* Dorea stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis* bird;  
3237 N.L. gen. n. *stercoravium* of bird faeces)

3238

3239 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3240 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3241 assigned the MAG ID ChiSjej1B19-6982 and which is available via NCBI BioSample  
3242 SAMN15816837. This is a new name for the alphanumeric GTDB species sp002160985. The  
3243 GC content of the type genome is 55.00% and the genome length is 2.5 Mbp.

3244

3245

3246 **Description of *Candidatus* Duodenibacillus intestinavium sp. nov.**

3247 *Candidatus* Duodenibacillus intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem.  
3248 n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

3249

3250 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3251 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3252 assigned the MAG ID 2430 and which is available via NCBI BioSample SAMN15816841. This  
3253 is a new name for the alphanumeric GTDB species sp900538905. The GC content of the type  
3254 genome is 55.01% and the genome length is 1.8 Mbp.

3255

3256

3257 **Description of *Candidatus Duodenibacillus intestinigallinarum* sp. nov.**

3258 *Candidatus* Duodenibacillus intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
3259 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

3260

3261 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3262 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3263 assigned the MAG ID CHK1-2119 and which is available via NCBI BioSample  
3264 SAMN15816840. This is a new name for the alphanumeric GTDB species sp003472385. The  
3265 GC content of the type genome is 56.00% and the genome length is 2.0 Mbp.

3266

3267

3268 **Description of *Candidatus Egerieenecus* gen. nov.**

3269 *Candidatus* Egerieenecus (E.ger.i.een.e'cus. L. fem. n. *egeries* dung; Gr. masc. *enoikos*  
3270 inhabitant; N.L. masc. n. *Egerieenecus* a microbe associated with faeces)

3271

3272 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3273 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3274 species *Egerieenecus merdigallinarum*. This is a name for the alphanumeric GTDB genus  
3275 UMG51600. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
3276 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
3277 *CAG-74*.

3278

3279

3280 **Description of *Candidatus Egerieenecus merdigallinarum* sp. nov.**

3281 *Candidatus* Egerieenecus merdigallinarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
3282 n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

3283

3284 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3285 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3286 assigned the MAG ID ChiSxjej2B14-4419 and which is available via NCBI BioSample  
3287 SAMN15817218. This is a new name for the alphanumeric GTDB species sp900553295. The  
3288 GC content of the type genome is 60.15% and the genome length is 2.5 Mbp.

3289

3290

3291 **Description of *Candidatus Egerieicola* gen. nov.**

3292 *Candidatus* Egerieicola (E.ger.i.ei.co'la. L. fem. n. *egeries* dung; L. suff. *-cola* inhabitant of; N.L.  
3293 fem. n. *Egerieicola* a microbe associated with faeces)

3294

3295 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3296 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3297 species *Egerieicola faecale*. This is a name for the alphanumeric GTDB genus UBA1375. This  
3298 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
3299 al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Ruminococcaceae*.

3300

3301

3302 **Description of *Candidatus Egerieicola faecale* sp. nov.**

3303 *Candidatus Egerieicola faecale* (fae.ca'le. L. neut. adj. *faecale* of faeces)

3304

3305 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3306 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3307 assigned the MAG ID 4509 and which is available via NCBI BioSample SAMN15817200. This  
3308 is a new name for the alphanumeric GTDB species sp002305795. The GC content of the type  
3309 genome is 55.66% and the genome length is 1.8 Mbp.

3310

3311

3312 **Description of *Candidatus Egerieicola pullicola* sp. nov.**

3313 *Candidatus Egerieicola pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
3314 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

3315

3316 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3317 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3318 assigned the MAG ID CHK184-25365 and which is available via NCBI BioSample  
3319 SAMN15817017. The GC content of the type genome is 52.81% and the genome length is 1.9  
3320 Mbp.

3321

3322

3323 **Description of *Candidatus Egerieimonas* gen. nov.**

3324 *Candidatus Egerieimonas* (E.ger.i.eimo'nas. L. fem. n. *egeries* dung; L. fem. n. *monas* a monad;  
3325 N.L. fem. n. *Egerieimonas* a microbe associated with faeces)

3326

3327 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3328 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3329 species *Egerieimonas intestinavium*. This is a name for the alphanumeric GTDB genus  
3330 UMGS1472. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
3331 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
3332 *Lachnospiraceae*.

3333

3334

3335 **Description of *Candidatus Egerieimonas faecigallarum* sp. nov.**

3336 *Candidatus Egerieimonas faecigallarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
3337 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

3338

3339 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3340 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3341 assigned the MAG ID CHK180-10209 and which is available via NCBI BioSample  
3342 SAMN15817015. The GC content of the type genome is 51.75% and the genome length is 2.9  
3343 Mbp.

3344  
3345

3346 **Description of *Candidatus Egerieimonas intestinavium* sp. nov.**

3347 *Candidatus Egerieimonas intestinavium* (chicken faeces *intestinum* gut; L. fem. n. *avis* bird;  
3348 N.L. gen. n. *intestinavium* of the gut of birds)

3349

3350 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3351 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3352 assigned the MAG ID ChiSxjej1B13-7041 and which is available via NCBI BioSample  
3353 SAMN15817079. The GC content of the type genome is 55.23% and the genome length is 2.6  
3354 Mbp.

3355  
3356

3357 **Description of *Candidatus Egerieisoma* gen. nov.**

3358 *Candidatus Egerieisoma* (E.ger.i.ei.so'ma. L. fem. n. *egeries* dung; Gr. neut. n. *soma* a body;  
3359 N.L. neut. n. *Egerieisoma* a microbe associated with faeces)

3360

3361 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3362 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3363 species *Egerieisoma faecipullorum*. This is a name for the alphanumeric GTDB genus  
3364 UMG51537. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
3365 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *UBA1212* and to the family  
3366 *UBA1255*.

3367  
3368

3369 **Description of *Candidatus Egerieisoma faecipullorum* sp. nov.**

3370 *Candidatus Egerieisoma faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
3371 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

3372

3373 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3374 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3375 assigned the MAG ID CHK195-4489 and which is available via NCBI BioSample  
3376 SAMN15817230. This is a new name for the alphanumeric GTDB species sp900543695. The  
3377 GC content of the type genome is 50.69% and the genome length is 2.0 Mbp.

3378  
3379

3380 **Description of *Candidatus Egerieousia* gen. nov.**

3381 *Candidatus Egerieousia* (E.ger.i.e.ou'si.a. L. fem. n. *egeries* dung; Gr. fem. n. *ousia* an essence;  
3382 N.L. fem. n. *Egerieousia* a microbe associated with faeces)

3383

3384 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3385 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3386 species *Egerieousia excrementavium*. This is a name for the alphanumeric GTDB genus

3387 UBA1232. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
3388 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family  
3389 *UBA932*.

3390  
3391

3392 **Description of *Candidatus Egerieousia excrementavium* sp. nov.**

3393 *Candidatus* Egerieousia excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
3394 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

3395

3396 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3397 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3398 assigned the MAG ID 15467 and which is available via NCBI BioSample SAMN15817149. The  
3399 GC content of the type genome is 46.96% and the genome length is 1.5 Mbp.

3400

3401

3402 **Description of *Candidatus Eisenbergiella intestinigallarum* sp. nov.**

3403 *Candidatus* Eisenbergiella intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
3404 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

3405

3406 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3407 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3408 assigned the MAG ID ChiBcec1-1630 and which is available via NCBI BioSample  
3409 SAMN15816806. This is a new name for the alphanumeric GTDB species sp900544445. The  
3410 GC content of the type genome is 53.15% and the genome length is 3.4 Mbp.

3411

3412

3413 **Description of *Candidatus Eisenbergiella intestinipullorum* sp. nov.**

3414 *Candidatus* Eisenbergiella intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
3415 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

3416

3417 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3418 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3419 assigned the MAG ID CHK177-9469 and which is available via NCBI BioSample  
3420 SAMN15816580. The GC content of the type genome is 54.63% and the genome length is 3.5  
3421 Mbp.

3422

3423

3424 **Description of *Candidatus Eisenbergiella merdavium* sp. nov.**

3425 *Candidatus* Eisenbergiella merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
3426 bird; N.L. gen. n. *merdavium* of bird faeces)

3427

3428 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3429 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3430 assigned the MAG ID USAMLcec2-132 and which is available via NCBI BioSample  
3431 SAMN15816641. The GC content of the type genome is 54.07% and the genome length is 4.2  
3432 Mbp.

**Description of *Candidatus Eisenbergiella merdigallarum* sp. nov.**

*Candidatus Eisenbergiella merdigallarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID USAMLcec3-2134 and which is available via NCBI BioSample SAMN15816643. The GC content of the type genome is 57.03% and the genome length is 3.2 Mbp.

**Description of *Candidatus Eisenbergiella merdipullorum* sp. nov.**

*Candidatus Eisenbergiella merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID CHK179-7159 and which is available via NCBI BioSample SAMN15816597. The GC content of the type genome is 51.92% and the genome length is 3.5 Mbp.

**Description of *Candidatus Eisenbergiella pullicola* sp. nov.**

*Candidatus Eisenbergiella pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -*cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID CHK197-24098 and which is available via NCBI BioSample SAMN15816836. This is a new name for the alphanumeric GTDB species sp003343625. The GC content of the type genome is 54.54% and the genome length is 2.6 Mbp.

**Description of *Candidatus Eisenbergiella pullistercoris* sp. nov.**

*Candidatus Eisenbergiella pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiSxjej3B15-24422 and which is available via NCBI BioSample SAMN15816711. The GC content of the type genome is 56.23% and the genome length is 3.3 Mbp.

3479 **Description of *Candidatus Eisenbergiella stercoravium* sp. nov.**

3480 *Candidatus* Eisenbergiella stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
3481 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

3482

3483 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3484 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3485 assigned the MAG ID USAMLcec4-2206 and which is available via NCBI BioSample  
3486 SAMN15816624. The GC content of the type genome is 51.92% and the genome length is 3.9  
3487 Mbp.

3488

3489

3490 **Description of *Candidatus Eisenbergiella stercorigallarum* sp. nov.**

3491 *Candidatus* Eisenbergiella stercorigallarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
3492 fem. n. *gallina* hen; N.L. gen. n. *stercorigallarum* of hen faeces)

3493

3494 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3495 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3496 assigned the MAG ID ChiHjej8B7-25341 and which is available via NCBI BioSample  
3497 SAMN15816792. The GC content of the type genome is 55.79% and the genome length is 2.8  
3498 Mbp.

3499

3500

3501 **Description of *Candidatus Enterenecus* gen. nov.**

3502 *Candidatus* Enterenecus (En.ter.en.e'cus. Gr. neut. n. *enteron* the gut; Gr. masc. *enoikos*  
3503 inhabitant; N.L. masc. n. *Enterenecus* a microbe associated with the intestines)

3504

3505 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3506 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3507 species *Enterenecus merdae*. This is a name for the alphanumeric GTDB genus UBA9475. This  
3508 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
3509 al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Oscillospiraceae*.

3510

3511

3512 **Description of *Candidatus Enterenecus avicola* sp. nov.**

3513 *Candidatus* Enterenecus avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
3514 n. *avicola* inhabitant of birds)

3515

3516 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3517 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3518 assigned the MAG ID 153 and which is available via NCBI BioSample SAMN15817108. The  
3519 GC content of the type genome is 60.43% and the genome length is 1.9 Mbp.

3520

3521

3522 **Description of *Candidatus Enterenecus avistercoris* sp. nov.**

3523 *Candidatus* Enterenecus avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
3524 dung; N.L. gen. n. *avistercoris* of bird faeces)

3525

3526 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3527 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3528 assigned the MAG ID ChiSxjej3B15-11837 and which is available via NCBI BioSample  
3529 SAMN15817165. The GC content of the type genome is 64.30% and the genome length is 1.5  
3530 Mbp.

3531

3532

3533 **Description of *Candidatus Enterenecus faecium* sp. nov.**

3534 *Candidatus* Enterenecus faecium (fae'ci.um. L. fem. n. *faex*, *faecis* excrement; L. masc. gen.pl. n.  
3535 *faecium* of faeces)

3536

3537 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3538 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3539 assigned the MAG ID ChiGjej2B2-12916 and which is available via NCBI BioSample  
3540 SAMN15817211. This is a new name for the alphanumeric GTDB species sp002161675. The  
3541 GC content of the type genome is 60.00% and the genome length is 2.0 Mbp.

3542

3543

3544 **Description of *Candidatus Enterenecus merdae* sp. nov.**

3545 *Candidatus* Enterenecus merdae (mer'dae. L. gen. n. *merdae* of faeces)

3546

3547 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3548 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3549 assigned the MAG ID ChiHcolR17-2730 and which is available via NCBI BioSample  
3550 SAMN15817102. The GC content of the type genome is 63.48% and the genome length is 1.7  
3551 Mbp.

3552

3553

3554 **Description of *Candidatus Enterenecus stercoripullorum* sp. nov.**

3555 *Candidatus* Enterenecus stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
3556 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

3557

3558 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3559 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3560 assigned the MAG ID 3668 and which is available via NCBI BioSample SAMN15817106. The  
3561 GC content of the type genome is 60.97% and the genome length is 1.8 Mbp.

3562

3563

3564 **Description of *Candidatus Enterocloster excrementigallinarum* sp. nov.**

3565 *Candidatus* Enterocloster excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
3566 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
3567 excrement)

3568

3569 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3570 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

3571 assigned the MAG ID CHK198-12963 and which is available via NCBI BioSample  
3572 SAMN15816811. This is a new name for the alphanumeric GTDB species sp900547035. The  
3573 GC content of the type genome is 51.32% and the genome length is 3.1 Mbp.

3574  
3575

3576 **Description of *Candidatus Enterocloster excrementipullorum* sp. nov.**

3577 *Candidatus* Enterocloster excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
3578 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
3579 chicken excrement)

3580

3581 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3582 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3583 assigned the MAG ID CHK180-15479 and which is available via NCBI BioSample  
3584 SAMN15816584. The GC content of the type genome is 53.85% and the genome length is 2.9  
3585 Mbp.

3586

3587

3588 **Description of *Candidatus Enterocloster faecavium* sp. nov.**

3589 *Candidatus* Enterocloster faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
3590 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

3591

3592 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3593 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3594 assigned the MAG ID CHK188-4685 and which is available via NCBI BioSample  
3595 SAMN15816596. The GC content of the type genome is 52.23% and the genome length is 2.8  
3596 Mbp.

3597

3598

3599 **Description of *Candidatus Enterococcus avicola* sp. nov.**

3600 *Candidatus* Enterococcus avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
3601 N.L. n. *avicola* inhabitant of birds)

3602

3603 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3604 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3605 assigned the MAG ID CHK172-16539 and which is available via NCBI BioSample  
3606 SAMN15816900. Although GTDB has assigned this species to the genus it calls *Enterococcus\_I*  
3607 , this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
3608 species, we have used the current validly published name for the genus. The GC content of the  
3609 type genome is 36.87% and the genome length is 2.2 Mbp.

3610

3611

3612 **Description of *Candidatus Enterococcus stercoravium* sp. nov.**

3613 *Candidatus* Enterococcus stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
3614 bird; N.L. gen. n. *stercoravium* of bird faeces)

3615

3616 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3617 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3618 assigned the MAG ID CHK172-14336 and which is available via NCBI BioSample  
3619 SAMN15816907. Although GTDB has assigned this species to the genus it calls  
3620 *Enterococcus\_C*, this genus designation cannot be incorporated into a well-formed binomial, so  
3621 in naming this species, we have used the current validly published name for the genus. The GC  
3622 content of the type genome is 44.16% and the genome length is 2.3 Mbp.

3623  
3624

3625 **Description of *Candidatus Enterococcus stercoripullorum* sp. nov.**

3626 *Candidatus Enterococcus stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
3627 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)  
3628

3629 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3630 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3631 assigned the MAG ID ChiHjej12B11-924 and which is available via NCBI BioSample  
3632 SAMN15816914. Although GTDB has assigned this species to the genus it calls *Enterococcus\_E*  
3633, this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
3634 species, we have used the current validly published name for the genus. The GC content of the  
3635 type genome is 36.20% and the genome length is 2.3 Mbp.

3636  
3637

3638 **Description of *Candidatus Enterocola* gen. nov.**

3639 *Candidatus Enterocola* (En.ter.o.co'la. Gr. neut. n. *enteron* the gut; L. suff. *-cola* inhabitant of;  
3640 N.L. fem. n. *Enterocola* a microbe associated with faeces)

3641

3642 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3643 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3644 species *Enterocola intestinipullorum*. This is a name for the alphanumeric GTDB genus  
3645 RUG163. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
3646 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family  
3647 *Paludibacteraceae*.

3648  
3649

3650 **Description of *Candidatus Enterocola intestinipullorum* sp. nov.**

3651 *Candidatus Enterocola intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
3652 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)  
3653

3654 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3655 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3656 assigned the MAG ID D3-1215 and which is available via NCBI BioSample SAMN15817113.  
3657 The GC content of the type genome is 47.46% and the genome length is 1.8 Mbp.

3658  
3659

3660 **Description of *Candidatus Enteromonas* gen. nov.**

3661 *Candidatus* Enteromonas (En.ter.omo'nas. Gr. neut. n. *enteron* the gut; L. fem. n. *monas* a  
3662 monad; N.L. fem. n. *Enteromonas* a microbe associated with the intestines)

3663

3664 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3665 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3666 species *Enteromonas pullistercoris*. This is a name for the alphanumeric GTDB genus UBA733.  
3667 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
3668 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFN20* and to the family *CAG-826*.

3669

3670

3671 **Description of *Candidatus* Enteromonas pullicola sp. nov.**

3672 *Candidatus* Enteromonas pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
3673 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

3674

3675 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3676 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3677 assigned the MAG ID ChiGjej1B1-22543 and which is available via NCBI BioSample  
3678 SAMN15817133. The GC content of the type genome is 57.43% and the genome length is 1.2  
3679 Mbp.

3680

3681

3682 **Description of *Candidatus* Enteromonas pullistercoris sp. nov.**

3683 *Candidatus* Enteromonas pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
3684 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

3685

3686 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3687 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3688 assigned the MAG ID 17113 and which is available via NCBI BioSample SAMN15817142. The  
3689 GC content of the type genome is 53.99% and the genome length is 1.4 Mbp.

3690

3691

3692 **Description of *Candidatus* Enterosoma gen. nov.**

3693 *Candidatus* Enterosoma (En.ter.o.so'ma. Gr. neut. n. *enteron* the gut; Gr. neut. n. *soma* a body;  
3694 N.L. neut. n. *Enterosoma* a microbe associated with the intestines)

3695

3696 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3697 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3698 species *Enterosoma merdigallarum*. This is a name for the alphanumeric GTDB genus  
3699 UBA7642. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
3700 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFN20* and to the family *CAG-288*.

3701

3702

3703 **Description of *Candidatus* Enterosoma merdigallarum sp. nov.**

3704 *Candidatus* Enterosoma merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
3705 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

3706

3707 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3708 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3709 assigned the MAG ID 33044 and which is available via NCBI BioSample SAMN15817141. The  
3710 GC content of the type genome is 51.22% and the genome length is 1.4 Mbp.

3711  
3712

3713 **Description of *Candidatus Enterousia* gen. nov.**

3714 *Candidatus* Enterousia (En.ter.ou'si.a. Gr. neut. n. *enteron* the gut; Gr. fem. n. *ousia* an essence;  
3715 N.L. fem. n. *Enterousia* a microbe associated with the intestines)

3716

3717 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3718 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3719 species *Enterousia excrementavium*. This is a name for the alphanumeric GTDB genus Rs-D84.  
3720 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
3721 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Rs-D84* and to the family *Rs-D84*.

3722

3723

3724 **Description of *Candidatus Enterousia avicola* sp. nov.**

3725 *Candidatus* Enterousia avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
3726 n. *avicola* inhabitant of birds)

3727

3728 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3729 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3730 assigned the MAG ID CHK136-897 and which is available via NCBI BioSample  
3731 SAMN15817144. The GC content of the type genome is 39.01% and the genome length is 0.9  
3732 Mbp.

3733

3734

3735 **Description of *Candidatus Enterousia avistercoris* sp. nov.**

3736 *Candidatus* Enterousia avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
3737 N.L. gen. n. *avistercoris* of bird faeces)

3738

3739 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3740 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3741 assigned the MAG ID 8207 and which is available via NCBI BioSample SAMN15817150. The  
3742 GC content of the type genome is 43.79% and the genome length is 0.8 Mbp.

3743

3744

3745 **Description of *Candidatus Enterousia excrementavium* sp. nov.**

3746 *Candidatus* Enterousia excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
3747 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

3748

3749 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3750 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3751 assigned the MAG ID B1-16210 and which is available via NCBI BioSample SAMN15817158.  
3752 The GC content of the type genome is 44.26% and the genome length is 0.9 Mbp.

3753

3754

**Description of *Candidatus Enterousia intestinigallarum* sp. nov.**

3756 *Candidatus* Enterousia intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.  
3757 fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

3758

3759 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3760 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3761 assigned the MAG ID ChiGjej3B3-5194 and which is available via NCBI BioSample  
3762 SAMN15817183. This is a new name for the alphanumeric GTDB species sp900546185. The  
3763 GC content of the type genome is 45.89% and the genome length is 0.9 Mbp.

3764

3765

**Description of *Candidatus Erysipelatoclostridium merdavium* sp. nov.**

3767 *Candidatus* Erysipelatoclostridium merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem.  
3768 n. *avis* bird; N.L. gen. n. *merdavium* of bird faeces)

3769

3770 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3771 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3772 assigned the MAG ID ChiGjej1B1-14440 and which is available via NCBI BioSample  
3773 SAMN15816860. This is a new name for the alphanumeric GTDB species sp002160495. The  
3774 GC content of the type genome is 29.32% and the genome length is 2.6 Mbp.

3775

3776

**Description of *Candidatus Eubacterium avistercoris* sp. nov.**

3778 *Candidatus* Eubacterium avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
3779 dung; N.L. gen. n. *avistercoris* of bird faeces)

3780

3781 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3782 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3783 assigned the MAG ID CHK192-9172 and which is available via NCBI BioSample  
3784 SAMN15816888. Although GTDB has assigned this species to the genus it calls *Eubacterium\_I*,  
3785 this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
3786 species, we have used the current validly published name for the genus. The GC content of the  
3787 type genome is 45.90% and the genome length is 2.6 Mbp.

3788

3789

**Description of *Candidatus Eubacterium faecale* sp. nov.**

3791 *Candidatus* Eubacterium faecale (fae.ca'le. L. neut. adj. *faecale* of faeces)

3792

3793 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3794 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3795 assigned the MAG ID CHK188-16595 and which is available via NCBI BioSample  
3796 SAMN15816917. This is a new name for the alphanumeric GTDB species sp000431535.

3797 Although GTDB has assigned this species to the genus it calls *Eubacterium\_R*, this genus

3798 designation cannot be incorporated into a well-formed binomial, so in naming this species, we

3799 have used the current validly published name for the genus. The GC content of the type genome  
3800 is 46.56% and the genome length is 1.8 Mbp.

3801

3802

3803 **Description of *Candidatus Eubacterium faecavium* sp. nov.**

3804 *Candidatus Eubacterium faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
3805 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

3806

3807 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3808 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3809 assigned the MAG ID ChiHecec3B27-3607 and which is available via NCBI BioSample  
3810 SAMN15816921. This is a new name for the alphanumeric GTDB species sp900539845.

3811 Although GTDB has assigned this species to the genus it calls *Eubacterium\_R*, this genus  
3812 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
3813 have used the current validly published name for the genus. The GC content of the type genome  
3814 is 45.56% and the genome length is 1.9 Mbp.

3815

3816

3817 **Description of *Candidatus Eubacterium faecigallinarum* sp. nov.**

3818 *Candidatus Eubacterium faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
3819 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

3820

3821 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3822 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3823 assigned the MAG ID 8396 and which is available via NCBI BioSample SAMN15816904.

3824 Although GTDB has assigned this species to the genus it calls *Eubacterium\_R*, this genus  
3825 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
3826 have used the current validly published name for the genus. The GC content of the type genome  
3827 is 43.37% and the genome length is 1.6 Mbp.

3828

3829

3830 **Description of *Candidatus Eubacterium faecipullorum* sp. nov.**

3831 *Candidatus Eubacterium faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
3832 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

3833

3834 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3835 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3836 assigned the MAG ID 421 and which is available via NCBI BioSample SAMN15816928. This is  
3837 a new name for the alphanumeric GTDB species sp900546785. Although GTDB has assigned  
3838 this species to the genus it calls *Eubacterium\_R*, this genus designation cannot be incorporated  
3839 into a well-formed binomial, so in naming this species, we have used the current validly  
3840 published name for the genus. The GC content of the type genome is 47.26% and the genome  
3841 length is 1.9 Mbp.

3842

3843

3844 **Description of *Candidatus Eubacterium pullicola* sp. nov.**

3845 *Candidatus* Eubacterium pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
3846 inhabitant of; N.L. n. *pullicola* inhabitant of young chicken)

3847

3848 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3849 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3850 assigned the MAG ID ChiHjej12B11-11929 and which is available via NCBI BioSample  
3851 SAMN15816916. This is a new name for the alphanumeric GTDB species sp900540015.  
3852 Although GTDB has assigned this species to the genus it calls Eubacterium\_M, this genus  
3853 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
3854 have used the current validly published name for the genus. The GC content of the type genome  
3855 is 41.55% and the genome length is 1.2 Mbp.

3856

3857

3858 **Description of *Candidatus* Evtetia excrementipullorum sp. nov.**

3859 *Candidatus* Evtetia excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
3860 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
3861 chicken excrement)

3862

3863 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3864 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3865 assigned the MAG ID ChiSjej3B21-3892 and which is available via NCBI BioSample  
3866 SAMN15816827. This is a new name for the alphanumeric GTDB species sp900546255. The  
3867 GC content of the type genome is 63.06% and the genome length is 2.0 Mbp.

3868

3869

3870 **Description of *Candidatus* Evtetia faecavium sp. nov.**

3871 *Candidatus* Evtetia faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
3872 bird; N.L. gen. n. *faecavium* of bird faeces)

3873

3874 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3875 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3876 assigned the MAG ID ChiHecec3B27-8621 and which is available via NCBI BioSample  
3877 SAMN15816713. The GC content of the type genome is 65.40% and the genome length is 2.0  
3878 Mbp.

3879

3880

3881 **Description of *Candidatus* Evtetia faecigallarum sp. nov.**

3882 *Candidatus* Evtetia faecigallarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
3883 fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

3884

3885 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3886 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3887 assigned the MAG ID ChiHcec3-601 and which is available via NCBI BioSample  
3888 SAMN15816724. The GC content of the type genome is 63.50% and the genome length is 2.4  
3889 Mbp.

3890

3891

**3892 Description of *Candidatus Excrementavichristensenella* gen. nov.**

3893 *Candidatus* Excrementavichristensenella (Ex.cre.ment.a.vi.chris.ten.sen.el'la. L. neut. n.  
3894 *excrementum* excrement; L. fem. n. *avis* bird; N.L. fem. n. *Christensenella* a genus name; N.L.  
3895 fem n. *Excrementavichristensenella* a genus related to the genus *Christensenella* but distinct  
3896 from it and found in poultry faeces)

3897

3898 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
3899 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
3900 species *Excrementavichristensenella intestinipullorum*. This genus has been assigned by GTDB-  
3901 Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
3902 order *Christensenellales* and to the family *CAG-74*.

3903

3904

**3905 Description of *Candidatus Excrementavichristensenella intestinipullorum* sp. nov.**

3906 *Candidatus* Excrementavichristensenella intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n.  
3907 *intestinum* gut; L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of  
3908 young chickens)

3909

3910 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3911 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3912 assigned the MAG ID ChiGjej2B2-1688 and which is available via NCBI BioSample  
3913 SAMN15816955. The GC content of the type genome is 62.99% and the genome length is 2.8  
3914 Mbp.

3915

3916

**3917 Description of *Candidatus Faecalibacterium avium* sp. nov.**

3918 *Candidatus* Faecalibacterium avium (a'vi.um. L. fem. pl. n. *avium* of birds)

3919

3920 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3921 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3922 assigned the MAG ID CHK182-10647 and which is available via NCBI BioSample  
3923 SAMN15816876. This is a new name for the alphanumeric GTDB species sp002160915. The  
3924 GC content of the type genome is 62.96% and the genome length is 2.2 Mbp.

3925

3926

**3927 Description of *Candidatus Faecalibacterium faecigallinarum* sp. nov.**

3928 *Candidatus* Faecalibacterium faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
3929 *excrement*; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

3930

3931 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3932 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3933 assigned the MAG ID ChiSjej5B23-2810 and which is available via NCBI BioSample  
3934 SAMN15816583. The GC content of the type genome is 63.38% and the genome length is 2.1  
3935 Mbp.

3936

3937

**3938 Description of *Candidatus Faecalibacterium faecipullorum* sp. nov.**

3939 *Candidatus* Faecalibacterium faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement;  
3940 L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

3941

3942 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3943 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3944 assigned the MAG ID ChiHjej9B8-13557 and which is available via NCBI BioSample  
3945 SAMN15816651. The GC content of the type genome is 65.75% and the genome length is 2.1  
3946 Mbp.

3947

3948

**3949 Description of *Candidatus Faecalibacterium gallistercoris* sp. nov.**

3950 *Candidatus* Faecalibacterium gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut.  
3951 n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

3952

3953 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3954 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3955 assigned the MAG ID ChiBcec16-3735 and which is available via NCBI BioSample  
3956 SAMN15816605. The GC content of the type genome is 64.68% and the genome length is 2.1  
3957 Mbp.

3958

3959

**3960 Description of *Candidatus Faecalibacterium intestinavium* sp. nov.**

3961 *Candidatus* Faecalibacterium intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem.  
3962 n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

3963

3964 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3965 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3966 assigned the MAG ID 742 and which is available via NCBI BioSample SAMN15816744. The  
3967 GC content of the type genome is 61.60% and the genome length is 1.8 Mbp.

3968

3969

**3970 Description of *Candidatus Faecalibacterium intestinigallinarum* sp. nov.**

3971 *Candidatus* Faecalibacterium intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
3972 gut; L.fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

3973

3974 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3975 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3976 assigned the MAG ID ChiHcolR34-3080 and which is available via NCBI BioSample  
3977 SAMN15816770. The GC content of the type genome is 64.34% and the genome length is 2.1  
3978 Mbp.

3979

3980

**3981 Description of *Candidatus Faecalibacterium intestinipullorum* sp. nov.**

3982 *Candidatus* Faecalibacterium intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut;  
3983 L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

3984

3985 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3986 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3987 assigned the MAG ID ChiHcolR21-11242 and which is available via NCBI BioSample  
3988 SAMN15816785. The GC content of the type genome is 61.39% and the genome length is 2.1  
3989 Mbp.

3990

3991

3992 **Description of *Candidatus* Faecalicoccus intestinipullorum sp. nov.**

3993 *Candidatus* Faecalicoccus intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
3994 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

3995

3996 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
3997 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
3998 assigned the MAG ID ChiHjej8B7-5959 and which is available via NCBI BioSample  
3999 SAMN15816766. The GC content of the type genome is 40.89% and the genome length is 1.4  
4000 Mbp.

4001

4002

4003 **Description of *Candidatus* Faecaligallichristensenella gen. nov.**

4004 *Candidatus* Faecaligallichristensenella (Fae.ca.li.gal.li.chris.ten.sen.el'la. N.L. masc. adj. *faecalis*  
4005 pertaining to faeces; L. masc. n. *gallus* chicken; N.L. fem. n. *Christensenella* a genus name; N.L.  
4006 fem. n. *Faecaligallichristensenella* a genus related to the genus *Christensenella* but distinct from  
4007 it and found in poultry faeces)

4008

4009 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4010 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4011 species *Faecaligallichristensenella faecipullorum*. This genus was identified but not named by  
4012 Glendinning et al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release  
4013 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the  
4014 family *CAG-74*.

4015

4016

4017 **Description of *Candidatus* Faecaligallichristensenella faecipullorum sp. nov.**

4018 *Candidatus* Faecaligallichristensenella faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis*  
4019 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
4020 faeces)

4021

4022 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4023 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4024 assigned the MAG ID ChiSjej6B24-5839 and which is available via NCBI BioSample  
4025 SAMN15816940. The GC content of the type genome is 58.49% and the genome length is 2.6  
4026 Mbp.

4027

4028

**4029 Description of *Candidatus Faecenecus* gen. nov.**

4030 *Candidatus* Faecenecus (Faecen.e'cus. L. fem. n. *faex* dregs; Gr. masc. *enoikos* inhabitant; N.L.  
4031 masc. n. *Faecenecus* a microbe associated with faeces)

4032

4033 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4034 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4035 species *Faecenecus gallistercoris*. This is a name for the alphanumeric GTDB genus CAG-988.  
4036 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4037 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-611*.

4038

4039

**4040 Description of *Candidatus Faecenecus gallistercoris* sp. nov.**

4041 *Candidatus* Faecenecus gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n.  
4042 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

4043

4044 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4045 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4046 assigned the MAG ID CHK165-10780 and which is available via NCBI BioSample  
4047 SAMN15817166. This is a new name for the alphanumeric GTDB species sp003149915. The  
4048 GC content of the type genome is 34.49% and the genome length is 1.2 Mbp.

4049

4050

**4051 Description of *Candidatus Faecicola* gen. nov.**

4052 *Candidatus* Faecicola (Faec.i.co'la. L. fem. n. *faex* dregs; L. suff. *-cola* inhabitant of; N.L. fem.  
4053 n. *Faecicola* a microbe associated with faeces)

4054

4055 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4056 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4057 species *Faecicola pullistercoris*. This is a name for the alphanumeric GTDB genus CAG-1138.  
4058 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4059 (Chaumeil et al., 2019; Parks et al., 2020) to the order *4C28d-15* and to the family *CAG-917*.

4060

4061

**4062 Description of *Candidatus Faecicola pullistercoris* sp. nov.**

4063 *Candidatus* Faecicola pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L. fem.  
4064 n. *avis* bird; N.L. gen. n. *pullistercoris* of young chicken faeces)

4065

4066 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4067 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4068 assigned the MAG ID 5944 and which is available via NCBI BioSample SAMN15817151. The  
4069 GC content of the type genome is 48.54% and the genome length is 1.6 Mbp.

4070

4071

**4072 Description of *Candidatus Faecimonas* gen. nov.**

4073 *Candidatus* Faecimonas (Faec.i.mo'nas. L. fem. n. *faex* dregs; L. fem. n. *monas* a monad; N.L.  
4074 fem. n. *Faecimonas* a microbe associated with faeces)

4075  
4076 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4077 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4078 species *Faecimonas intestinavium*. This is a name for the alphanumeric GTDB genus CAG-877.  
4079 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4080 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-611*.

4081  
4082

4083 **Description of *Candidatus* Faecimonas gallistercoris sp. nov.**

4084 *Candidatus* Faecimonas gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n.  
4085 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

4086

4087 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4088 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4089 assigned the MAG ID CHK189-3136 and which is available via NCBI BioSample  
4090 SAMN15817016. The GC content of the type genome is 28.18% and the genome length is 1.4  
4091 Mbp.

4092  
4093

4094 **Description of *Candidatus* Faecimonas intestinavium sp. nov.**

4095 *Candidatus* Faecimonas intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
4096 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

4097

4098 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4099 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4100 assigned the MAG ID USAMLcec2-12447 and which is available via NCBI BioSample  
4101 SAMN15817225. This is a new name for the alphanumeric GTDB species sp900554305. The  
4102 GC content of the type genome is 29.22% and the genome length is 1.8 Mbp.

4103  
4104

4105 **Description of *Candidatus* Faecimorpha gen. nov.**

4106 *Candidatus* Faecimorpha (Faec.i.mor'pha. L. fem. n. *faex* dregs; Gr. fem. n. *morphe* a form,  
4107 shape; N.L. fem. n. *Faecimorpha* a microbe associated with faeces)

4108

4109 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4110 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4111 species *Faecimorpha stercoravium*. This is a name for the alphanumeric GTDB genus  
4112 UBA1390. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4113 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
4114 *UBA1390*.

4115  
4116

4117 **Description of *Candidatus* Faecimorpha stercoravium sp. nov.**

4118 *Candidatus* Faecimorpha stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
4119 bird; N.L. gen. n. *stercoravium* of bird faeces)

4120

4121 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4122 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4123 assigned the MAG ID CHK195-9767 and which is available via NCBI BioSample  
4124 SAMN15817172. This is a new name for the alphanumeric GTDB species sp002305315. The  
4125 GC content of the type genome is 49.81% and the genome length is 2.4 Mbp.

4126

4127

4128 **Description of *Candidatus* Faecioplasma gen. nov.**

4129 *Candidatus* Faecioplasma (Faec.i.plas'ma. L. fem. n. *faex* dregs; Gr. neut. n. *plasma* a form; N.L.  
4130 neut. n. *Faecioplasma* a microbe associated with faeces)

4131

4132 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4133 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4134 species *Faecioplasma avium*. This is a name for the alphanumeric GTDB genus UBA1409. This  
4135 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
4136 al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Ruminococcaceae*.

4137

4138

4139 **Description of *Candidatus* Faecioplasma avium sp. nov.**

4140 *Candidatus* Faecioplasma avium (a'vi.um. L. fem. pl. n. *avium* of birds)

4141

4142 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4143 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4144 assigned the MAG ID 1370 and which is available via NCBI BioSample SAMN15817208. This  
4145 is a new name for the alphanumeric GTDB species sp002305045. The GC content of the type  
4146 genome is 51.56% and the genome length is 1.6 Mbp.

4147

4148

4149 **Description of *Candidatus* Faecioplasma gallinarum sp. nov.**

4150 *Candidatus* Faecioplasma gallinarum (gal.li.na'rum. L. fem. n. *gallina* a hen; L. gen.fem. pl. n.  
4151 *gallinarum* of hens)

4152

4153 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4154 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4155 assigned the MAG ID CHK157-1446 and which is available via NCBI BioSample  
4156 SAMN15817182. This is a new name for the alphanumeric GTDB species sp002338885. The  
4157 GC content of the type genome is 49.59% and the genome length is 1.6 Mbp.

4158

4159

4160 **Description of *Candidatus* Faecioplasma pullistercoris sp. nov.**

4161 *Candidatus* Faecioplasma pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
4162 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

4163

4164 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4165 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4166 assigned the MAG ID CHK33-4379 and which is available via NCBI BioSample  
4167 SAMN15817120. The GC content of the type genome is 49.45% and the genome length is 1.5  
4168 Mbp.

4169  
4170

4171 **Description of *Candidatus Faecisoma* gen. nov.**

4172 *Candidatus Faecisoma* (Faec.i.so'ma. L. fem. n. *faex* dregs; Gr. neut. n. *soma* a body; N.L. neut.  
4173 n. *Faecisoma* a microbe associated with faeces)

4174

4175 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4176 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4177 species *Faecisoma merdavium*. This is a name for the alphanumeric GTDB genus CAG-878.

4178 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4179 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-822*.

4180

4181

4182 **Description of *Candidatus Faecisoma merdavium* sp. nov.**

4183 *Candidatus Faecisoma merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
4184 N.L. gen. n. *merdavium* of bird faeces)

4185

4186 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4187 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4188 assigned the MAG ID 6595 and which is available via NCBI BioSample SAMN15817101. The  
4189 GC content of the type genome is 24.63% and the genome length is 1.3 Mbp.

4190

4191

4192 **Description of *Candidatus Faecivicinus* gen. nov.**

4193 *Candidatus Faecivicinus* (Faec.i.vic.in'us. L. fem. n. *faex* dregs; L. masc. n. *vicinus* a neighbour;  
4194 N.L. masc. n. *Faecivicinus* a microbe associated with faeces)

4195

4196 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4197 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4198 species *Faecivicinus avistercoris*. This is a name for the alphanumeric GTDB genus  
4199 UMGS1603. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4200 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
4201 *CAG-74*.

4202

4203

4204 **Description of *Candidatus Faecivicinus avistercoris* sp. nov.**

4205 *Candidatus Faecivicinus avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
4206 dung; N.L. gen. n. *avistercoris* of bird faeces)

4207

4208 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4209 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

4210 assigned the MAG ID 905 and which is available via NCBI BioSample SAMN15817031. The  
4211 GC content of the type genome is 63.46% and the genome length is 2.7 Mbp.

4212  
4213

4214 **Description of *Candidatus Faecivivens* gen. nov.**

4215 *Candidatus Faecivivens* (Faec.i.viv'ens. L. fem. n. *faex* dregs; N.L. pres. part. *vivens* living; N.L.  
4216 fem. n. *Faecivivens* a microbe associated with faeces)

4217

4218 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4219 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4220 species *Faecivivens stercorigallinarum*. This is a name for the alphanumeric GTDB genus  
4221 UBA1448. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4222 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
4223 *Ruminococcaceae*.

4224

4225

4226 **Description of *Candidatus Faecivivens stercoravium* sp. nov.**

4227 *Candidatus Faecivivens stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
4228 bird; N.L. gen. n. *stercoravium* of bird faeces)

4229

4230 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4231 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4232 assigned the MAG ID CHK189-12415 and which is available via NCBI BioSample  
4233 SAMN15817018. The GC content of the type genome is 59.75% and the genome length is 2.3  
4234 Mbp.

4235

4236

4237 **Description of *Candidatus Faecivivens stercorigallinarum* sp. nov.**

4238 *Candidatus Faecivivens stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
4239 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

4240

4241 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4242 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4243 assigned the MAG ID 4960 and which is available via NCBI BioSample SAMN15817121. The  
4244 GC content of the type genome is 52.99% and the genome length is 2.2 Mbp.

4245

4246

4247 **Description of *Candidatus Faecivivens stercoripullorum* sp. nov.**

4248 *Candidatus Faecivivens stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
4249 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

4250

4251 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4252 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4253 assigned the MAG ID ChiBcec7-5410 and which is available via NCBI BioSample  
4254 SAMN15817124. The GC content of the type genome is 50.38% and the genome length is 2.0  
4255 Mbp.

4256

4257

**Description of *Candidatus Faecousia* gen. nov.**

4259 *Candidatus Faecousia* (Faec.ou'si.a. L. fem. n. *faex* dregs; Gr. fem. n. *ousia* an essence; N.L.  
4260 fem. n. *Faecousia* a microbe associated with faeces)

4261

4262 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4263 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4264 species *Faecousia intestinigallinarum*. This is a name for the alphanumeric GTDB genus CAG-  
4265 110. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4266 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
4267 *Oscillospiraceae*.

4268

4269

**Description of *Candidatus Faecousia excrementigallinarum* sp. nov.**

4271 *Candidatus Faecousia excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
4272 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
4273 excrement)

4274

4275 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4276 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4277 assigned the MAG ID 13361 and which is available via NCBI BioSample SAMN15817055. The  
4278 GC content of the type genome is 56.40% and the genome length is 1.9 Mbp.

4279

4280

**Description of *Candidatus Faecousia excrementipullorum* sp. nov.**

4282 *Candidatus Faecousia excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
4283 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
4284 chicken excrement)

4285

4286 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4287 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4288 assigned the MAG ID ChiSxjej6B18-3616 and which is available via NCBI BioSample  
4289 SAMN15817060. The GC content of the type genome is 56.19% and the genome length is 1.7  
4290 Mbp.

4291

4292

**Description of *Candidatus Faecousia faecavium* sp. nov.**

4294 *Candidatus Faecousia faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
4295 bird; N.L. gen. n. *faecavium* of bird faeces)

4296

4297 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4298 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4299 assigned the MAG ID ChiBcec21-2751 and which is available via NCBI BioSample  
4300 SAMN15817064. The GC content of the type genome is 53.76% and the genome length is 2.4  
4301 Mbp.

**Description of *Candidatus Faecousia faecigallinarum* sp. nov.**

*Candidatus* Faecousia faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiHcolR29-948 and which is available via NCBI BioSample SAMN15817073. The GC content of the type genome is 58.86% and the genome length is 1.9 Mbp.

**Description of *Candidatus Faecousia faecipullorum* sp. nov.**

*Candidatus* Faecousia faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiHecec2B26-1122 and which is available via NCBI BioSample SAMN15817098. The GC content of the type genome is 55.50% and the genome length is 1.9 Mbp.

**Description of *Candidatus Faecousia gallistercoris* sp. nov.**

*Candidatus* Faecousia gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID 7739 and which is available via NCBI BioSample SAMN15817186. This is a new name for the alphanumeric GTDB species sp900546915. The GC content of the type genome is 58.30% and the genome length is 1.8 Mbp.

**Description of *Candidatus Faecousia intestinavium* sp. nov.**

*Candidatus* Faecousia intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

A bacterial species identified by metagenomic analyses. This species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been assigned the MAG ID ChiHcec3-9842 and which is available via NCBI BioSample SAMN15817111. The GC content of the type genome is 57.16% and the genome length is 2.1 Mbp.

4348 **Description of *Candidatus Faecousia intestinigallinarum* sp. nov.**

4349 *Candidatus* Faecousia intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.  
4350 fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

4351

4352 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4353 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4354 assigned the MAG ID ChiSxjej3B15-29383 and which is available via NCBI BioSample  
4355 SAMN15817112. The GC content of the type genome is 55.74% and the genome length is 2.1  
4356 Mbp.

4357

4358

4359 **Description of *Candidatus Fimadaptatus* gen. nov.**

4360 *Candidatus* Fimadaptatus (Fim.adaptatus. L. neut. n. *fimum* dung; L. past part. masc. *adaptatus*  
4361 adapted to; N.L. masc. n. *Fimadaptatus* a microbe associated with faeces)

4362

4363 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4364 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4365 species *Fimadaptatus faecigallinarum*. This is a name for the alphanumeric GTDB genus  
4366 UMGS1633. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4367 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
4368 *CAG-74*.

4369

4370

4371 **Description of *Candidatus Fimadaptatus faecigallinarum* sp. nov.**

4372 *Candidatus* Fimadaptatus faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
4373 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

4374

4375 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4376 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4377 assigned the MAG ID ChiSxjej2B14-8506 and which is available via NCBI BioSample  
4378 SAMN15817140. The GC content of the type genome is 60.44% and the genome length is 2.8  
4379 Mbp.

4380

4381

4382 **Description of *Candidatus Fimenecus* gen. nov.**

4383 *Candidatus* Fimenecus (Fim.en.e'cus. L. neut. n. *fimum* dung; Gr. masc. *enoikos* inhabitant; N.L.  
4384 masc. n. *Fimenecus* a microbe associated with faeces)

4385

4386 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4387 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4388 species *Fimenecus excrementigallinarum*. This is a name for the alphanumeric GTDB genus  
4389 CAG-180. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4390 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
4391 *Acutalibacteraceae*.

4392

4393

4394 **Description of *Candidatus Fimenecus excrementavium* sp. nov.**

4395 *Candidatus Fimenecus excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
4396 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

4397

4398 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4399 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4400 assigned the MAG ID ChiSjej1B19-6168 and which is available via NCBI BioSample  
4401 SAMN15817011. The GC content of the type genome is 50.61% and the genome length is 1.8  
4402 Mbp.

4403

4404

4405 **Description of *Candidatus Fimenecus excrementigallinarum* sp. nov.**

4406 *Candidatus Fimenecus excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
4407 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
4408 excrement)

4409

4410 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4411 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4412 assigned the MAG ID ChiGjej1B1-19959 and which is available via NCBI BioSample  
4413 SAMN15817134. The GC content of the type genome is 60.29% and the genome length is 1.8  
4414 Mbp.

4415

4416

4417 **Description of *Candidatus Fimenecus stercoravium* sp. nov.**

4418 *Candidatus Fimenecus stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
4419 bird; N.L. gen. n. *stercoravium* of bird faeces)

4420

4421 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4422 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4423 assigned the MAG ID ChiHcolR13-3023 and which is available via NCBI BioSample  
4424 SAMN15817181. This is a new name for the alphanumeric GTDB species sp002314305. The  
4425 GC content of the type genome is 55.43% and the genome length is 1.9 Mbp.

4426

4427

4428 **Description of *Candidatus Fimicola* gen. nov.**

4429 *Candidatus Fimicola* (Fim.i.co'la. L. neut. n. *fimum* dung; L. suff. *-cola* inhabitant of; N.L. fem.  
4430 n. *Fimicola* a microbe associated with faeces)

4431

4432 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4433 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4434 species *Fimicola merdigallinarum*. This is a name for the alphanumeric GTDB genus An114.  
4435 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4436 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
4437 *Anaerotignaceae*.

4438

4439

4440 **Description of *Candidatus Fimicola cottocaccae* sp. nov.**

4441 *Candidatus Fimicola cottocaccae* (cot.to.cac'cae. Gr. masc. n. *kottos* chicken Gr. fem. n. *kakke*  
4442 faeces; N.L. gen. n. *cottocaccae* of chicken faeces)

4443

4444 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4445 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4446 assigned the MAG ID ChiW9-1577 and which is available via NCBI BioSample  
4447 SAMN15817191. This is a new name for the alphanumeric GTDB species sp002161055. The  
4448 GC content of the type genome is 31.91% and the genome length is 1.8 Mbp.

4449

4450

4451 **Description of *Candidatus Fimicola merdigallarum* sp. nov.**

4452 *Candidatus Fimicola merdigallarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n.  
4453 *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

4454

4455 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4456 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4457 assigned the MAG ID F6-4510 and which is available via NCBI BioSample SAMN15817136.  
4458 The GC content of the type genome is 32.46% and the genome length is 1.8 Mbp.

4459

4460

4461 **Description of *Candidatus Fimihabitans* gen. nov.**

4462 *Candidatus Fimihabitans* (Fim.i.hab.it'ans. L. neut. n. *fimum* dung; L. pres. part. *habitans* an  
4463 inhabitant; N.L. fem. n. *Fimihabitans* a microbe associated with faeces)

4464

4465 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4466 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4467 species *Fimihabitans intestinipullorum*. This is a name for the alphanumeric GTDB genus  
4468 UMGS1648. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4469 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-822*.

4470

4471

4472 **Description of *Candidatus Fimihabitans intestinipullorum* sp. nov.**

4473 *Candidatus Fimihabitans intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
4474 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

4475

4476 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4477 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4478 assigned the MAG ID CHK197-8231 and which is available via NCBI BioSample  
4479 SAMN15817229. This is a new name for the alphanumeric GTDB species sp900553765. The  
4480 GC content of the type genome is 33.44% and the genome length is 1.3 Mbp.

4481

4482

4483 **Description of *Candidatus Fimimonas* gen. nov.**

4484 *Candidatus Fimimonas* (Fim.i.mo'nas. L. neut. n. *fimum* dung; L. fem. n. *monas* a monad; N.L.  
4485 fem. n. *Fimimonas* a microbe associated with faeces)

4486

4487 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4488 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4489 species *Fimimonas gallinarum*. This is a name for the alphanumeric GTDB genus CAG-1435.  
4490 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4491 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family *CAG-*  
4492 *314*.

4493

4494

4495 **Description of *Candidatus Fimimonas gallinarum* sp. nov.**

4496 *Candidatus Fimimonas gallinarum* (gal.li.na'rum. L. fem. n. *gallina* a hen; L. gen.fem. pl. n.  
4497 *gallinarum* of hens)

4498

4499 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4500 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4501 assigned the MAG ID CHK121-14286 and which is available via NCBI BioSample  
4502 SAMN15817176. This is a new name for the alphanumeric GTDB species sp000433775. The  
4503 GC content of the type genome is 45.96% and the genome length is 1.4 Mbp.

4504

4505

4506 **Description of *Candidatus Fimimonas merdipullorum* sp. nov.**

4507 *Candidatus Fimimonas merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
4508 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

4509

4510 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4511 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4512 assigned the MAG ID ChiHjej12B11-7776 and which is available via NCBI BioSample  
4513 SAMN15817153. The GC content of the type genome is 53.17% and the genome length is 1.3  
4514 Mbp.

4515

4516

4517 **Description of *Candidatus Fimimorpha* gen. nov.**

4518 *Candidatus Fimimorpha* (Fim.i.mor'pha. L. neut. n. *fimum* dung; Gr. fem. n. *morphe* a form,  
4519 shape; N.L. fem. n. *Fimimorpha* a microbe associated with faeces)

4520

4521 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4522 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4523 species *Fimimorpha faecalis*. This is a name for the alphanumeric GTDB genus CHKCI001.  
4524 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4525 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
4526 *Lachnospiraceae*.

4527

4528

4529 **Description of *Candidatus Fimimorpha excrementavium* sp. nov.**

4530 *Candidatus Fimimorpha excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
4531 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

4532

4533 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4534 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4535 assigned the MAG ID CHK193-21555 and which is available via NCBI BioSample  
4536 SAMN15817029. The GC content of the type genome is 48.70% and the genome length is 3.1  
4537 Mbp.

4538

4539

4540 **Description of *Candidatus Fimimorpha faecalis* sp. nov.**

4541 *Candidatus Fimimorpha faecalis* (fae.ca'lis. L. fem. adj. *faecalis* of faeces)

4542

4543 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4544 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4545 assigned the MAG ID ChiW13-3771 and which is available via NCBI BioSample  
4546 SAMN15817177. This is a new name for the alphanumeric GTDB species sp900045905. The  
4547 GC content of the type genome is 36.24% and the genome length is 2.9 Mbp.

4548

4549

4550 **Description of *Candidatus Fimiplasma* gen. nov.**

4551 *Candidatus Fimiplasma* (Fim.i.plas'ma. L. neut. n. *fimum* dung; Gr. neut. n. *plasma* a form; N.L.  
4552 neut. n. *Fimiplasma* a microbe associated with faeces)

4553

4554 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4555 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4556 species *Fimiplasma intestinipullorum*. This is a name for the alphanumeric GTDB genus  
4557 CHKCI006. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
4558 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Erysipelotrichales* and to the family  
4559 *Erysipelatoclostridiaceae*.

4560

4561

4562 **Description of *Candidatus Fimiplasma intestinipullorum* sp. nov.**

4563 *Candidatus Fimiplasma intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
4564 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

4565

4566 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4567 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4568 assigned the MAG ID CHK195-11698 and which is available via NCBI BioSample  
4569 SAMN15817196. This is a new name for the alphanumeric GTDB species sp900018345. The  
4570 GC content of the type genome is 43.31% and the genome length is 2.5 Mbp.

4571

4572

4573 **Description of *Candidatus Fimisoma* gen. nov.**

4574 *Candidatus Fimisoma* (Fim.i.so'ma. L. neut. n. *fimum* dung; Gr. neut. n. *soma* a body; N.L. neut.  
4575 n. *Fimisoma* a microbe associated with faeces)

4576

4577 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4578 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4579 species *Fimisoma avicola*. This is a name for the alphanumeric GTDB genus CAG-145. This  
4580 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
4581 al., 2019; Parks et al., 2020) to the order *Peptostreptococcales* and to the family  
4582 *Anaerovoracaceae*.

4583  
4584

4585 **Description of *Candidatus Fimisoma avicola* sp. nov.**

4586 *Candidatus Fimisoma avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
4587 *avicola* inhabitant of birds)

4588

4589 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4590 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4591 assigned the MAG ID 11300 and which is available via NCBI BioSample SAMN15817197. This  
4592 is a new name for the alphanumeric GTDB species sp900542565. The GC content of the type  
4593 genome is 47.90% and the genome length is 2.0 Mbp.

4594

4595

4596 **Description of *Candidatus Fimivicinus* gen. nov.**

4597 *Candidatus Fimivicinus* (Fim.i.vic.in'us. L. neut. n. *fimum* dung; L. masc. n. *vicinus* a neighbour;  
4598 N.L. masc. n. *Fimivicinus* a microbe associated with faeces)

4599

4600 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4601 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4602 species *Fimivicinus intestinavium*. This is a name for the alphanumeric GTDB genus UBA1691.  
4603 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4604 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
4605 *Acutalibacteraceae*.

4606

4607

4608 **Description of *Candidatus Fimivicinus intestinavium* sp. nov.**

4609 *Candidatus Fimivicinus intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
4610 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

4611

4612 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4613 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4614 assigned the MAG ID 2526 and which is available via NCBI BioSample SAMN15817188. This  
4615 is a new name for the alphanumeric GTDB species sp900552985. The GC content of the type  
4616 genome is 55.20% and the genome length is 2.5 Mbp.

4617

4618

4619 **Description of *Candidatus Fimivivens* gen. nov.**

4620 *Candidatus Fimivivens* (Fim.i.viv'ens. L. neut. n. *fimum* dung; N.L. pres. part. *vivens* living; N.L.  
4621 fem. n. *Fimivivens* a microbe associated with faeces)

4622

4623 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4624 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4625 species *Fimivivens faecavium*. This is a name for the alphanumeric GTDB genus D5. This genus  
4626 has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al.,  
4627 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Ruminococcaceae*.

4628  
4629

4630 **Description of *Candidatus Fimivivens faecavium* sp. nov.**

4631 *Candidatus Fimivivens faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
4632 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

4633

4634 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4635 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4636 assigned the MAG ID CHK195-35099 and which is available via NCBI BioSample  
4637 SAMN15817038. The GC content of the type genome is 58.86% and the genome length is 2.0  
4638 Mbp.

4639

4640

4641 **Description of *Candidatus Fimousia* gen. nov.**

4642 *Candidatus Fimousia* (Fim.ou'si.a. L. neut. n. *fimum* dung; Gr. fem. n. *ousia* an essence; N.L.  
4643 fem. n. *Fimousia* a microbe associated with faeces)

4644

4645 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4646 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4647 species *Fimousia stercorigallarum*. This is a name for the alphanumeric GTDB genus 992a.  
4648 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4649 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
4650 *Lachnospiraceae*.

4651

4652

4653 **Description of *Candidatus Fimousia stercorigallarum* sp. nov.**

4654 *Candidatus Fimousia stercorigallarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L. fem.  
4655 n. *gallina* hen; N.L. gen. n. *stercorigallarum* of hen faeces)

4656

4657 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4658 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4659 assigned the MAG ID ChiSxje3B15-1827 and which is available via NCBI BioSample  
4660 SAMN15817114. The GC content of the type genome is 41.52% and the genome length is 2.3  
4661 Mbp.

4662

4663

4664 **Description of *Candidatus Flavonifractor avicola* sp. nov.**

4665 *Candidatus Flavonifractor avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
4666 N.L. n. *avicola* inhabitant of birds)

4667

4668 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4669 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4670 assigned the MAG ID CHK178-4001 and which is available via NCBI BioSample  
4671 SAMN15816843. This is a new name for the alphanumeric GTDB species sp002161085. The  
4672 GC content of the type genome is 60.44% and the genome length is 2.5 Mbp.  
4673

4674

4675 **Description of *Candidatus Flavonifractor avistercoris* sp. nov.**

4676 *Candidatus* Flavonifractor avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
4677 dung; N.L. gen. n. *avistercoris* of bird faeces)

4678

4679 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4680 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4681 assigned the MAG ID 6084 and which is available via NCBI BioSample SAMN15816821. This  
4682 is a new name for the alphanumeric GTDB species sp002161215. The GC content of the type  
4683 genome is 65.16% and the genome length is 2.4 Mbp.  
4684

4685

4686

4687 **Description of *Candidatus Flavonifractor intestinigallarum* sp. nov.**

4688 *Candidatus* Flavonifractor intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
4689 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

4690

4691 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4692 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4693 assigned the MAG ID CHK192-8294 and which is available via NCBI BioSample  
4694 SAMN15816592. The GC content of the type genome is 61.61% and the genome length is 2.5  
4695 Mbp.  
4696

4697

4698

4699 **Description of *Candidatus Flavonifractor intestinipullorum* sp. nov.**

4700 *Candidatus* Flavonifractor intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
4701 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

4702

4703 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4704 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4705 assigned the MAG ID CHK189-11263 and which is available via NCBI BioSample  
4706 SAMN15816594. The GC content of the type genome is 63.72% and the genome length is 2.2  
4707 Mbp.  
4708

4709

4710

4711 **Description of *Candidatus Flavonifractor merdaviium* sp. nov.**

4712 *Candidatus* Flavonifractor merdaviium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
4713 bird; N.L. gen. n. *merdaviium* of bird faeces)

4714

4715 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4716 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

4714 assigned the MAG ID 3313 and which is available via NCBI BioSample SAMN15816644. The  
4715 GC content of the type genome is 62.46% and the genome length is 2.7 Mbp.

4716  
4717

4718 **Description of *Candidatus Flavonifractor merdigallinarum* sp. nov.**

4719 *Candidatus* Flavonifractor merdigallinarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
4720 fem. n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

4721

4722 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4723 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4724 assigned the MAG ID ChiBcec16-6824 and which is available via NCBI BioSample  
4725 SAMN15816721. The GC content of the type genome is 61.09% and the genome length is 2.6  
4726 Mbp.

4727

4728

4729 **Description of *Candidatus Flavonifractor merdipullorum* sp. nov.**

4730 *Candidatus* Flavonifractor merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc.  
4731 n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

4732

4733 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4734 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4735 assigned the MAG ID ChiGjej6B6-1540 and which is available via NCBI BioSample  
4736 SAMN15816748. The GC content of the type genome is 61.06% and the genome length is 2.1  
4737 Mbp.

4738

4739

4740 **Description of *Candidatus Fournierella excrementavium* sp. nov.**

4741 *Candidatus* Fournierella excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
4742 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

4743

4744 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4745 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4746 assigned the MAG ID ChiHcec27-1717 and which is available via NCBI BioSample  
4747 SAMN15816881. This is a new name for the alphanumeric GTDB species sp004558145. The  
4748 GC content of the type genome is 63.90% and the genome length is 2.4 Mbp.

4749

4750

4751 **Description of *Candidatus Fournierella excrementigallinarum* sp. nov.**

4752 *Candidatus* Fournierella excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
4753 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
4754 excrement)

4755

4756 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4757 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4758 assigned the MAG ID 1136 and which is available via NCBI BioSample SAMN15816650. The  
4759 GC content of the type genome is 64.27% and the genome length is 2.1 Mbp.

4760

4761

**Description of *Candidatus Fournierella merdavium* sp. nov.**

4763 *Candidatus Fournierella merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
4764 N.L. gen. n. *merdavium* of bird faeces)

4765

4766 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4767 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4768 assigned the MAG ID ChiBcec4-1730 and which is available via NCBI BioSample  
4769 SAMN15816653. The GC content of the type genome is 64.33% and the genome length is 2.6  
4770 Mbp.

4771

4772

**Description of *Candidatus Fournierella merdigallinarum* sp. nov.**

4774 *Candidatus Fournierella merdigallinarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
4775 n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

4776

4777 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4778 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4779 assigned the MAG ID 6296 and which is available via NCBI BioSample SAMN15816675. The  
4780 GC content of the type genome is 65.05% and the genome length is 2.4 Mbp.

4781

4782

**Description of *Candidatus Fournierella merdipullorum* sp. nov.**

4784 *Candidatus Fournierella merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
4785 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

4786

4787 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4788 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4789 assigned the MAG ID ChiGjej4B4-18154 and which is available via NCBI BioSample  
4790 SAMN15816693. The GC content of the type genome is 62.57% and the genome length is 2.5  
4791 Mbp.

4792

4793

**Description of *Candidatus Fournierella pullicola* sp. nov.**

4795 *Candidatus Fournierella pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
4796 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

4797

4798 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4799 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4800 assigned the MAG ID 2239 and which is available via NCBI BioSample SAMN15816745. The  
4801 GC content of the type genome is 62.57% and the genome length is 2.4 Mbp.

4802

4803

**Description of *Candidatus Fournierella pullistercoris* sp. nov.**

4804

4805 *Candidatus* Fournierella pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
4806 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

4807

4808 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4809 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4810 assigned the MAG ID B5-2728 and which is available via NCBI BioSample SAMN15816762.  
4811 The GC content of the type genome is 52.45% and the genome length is 1.7 Mbp.

4812

4813

4814 **Description of *Candidatus* Fusicatenibacter intestinigallinarum sp. nov.**

4815 *Candidatus* Fusicatenibacter intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
4816 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

4817

4818 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4819 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4820 assigned the MAG ID CHK185-5351 and which is available via NCBI BioSample  
4821 SAMN15816585. The GC content of the type genome is 51.22% and the genome length is 2.9  
4822 Mbp.

4823

4824

4825 **Description of *Candidatus* Fusicatenibacter intestinipullorum sp. nov.**

4826 *Candidatus* Fusicatenibacter intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut;  
4827 L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

4828

4829 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4830 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4831 assigned the MAG ID ChiBcec11-5794 and which is available via NCBI BioSample  
4832 SAMN15816833. This is a new name for the alphanumeric GTDB species sp900543115. The  
4833 GC content of the type genome is 49.70% and the genome length is 2.6 Mbp.

4834

4835

4836 **Description of *Candidatus* Fusicatenibacter merdaviium sp. nov.**

4837 *Candidatus* Fusicatenibacter merdaviium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
4838 bird; N.L. gen. n. *merdaviium* of bird faeces)

4839

4840 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4841 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4842 assigned the MAG ID CHK183-1962 and which is available via NCBI BioSample  
4843 SAMN15816614. The GC content of the type genome is 51.02% and the genome length is 2.7  
4844 Mbp.

4845

4846

4847 **Description of *Candidatus* Fusobacterium pullicola sp. nov.**

4848 *Candidatus* Fusobacterium pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
4849 *cola* inhabitant of; N.L. n. *pullicola* inhabitant of a young chicken)

4850

4851 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4852 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4853 assigned the MAG ID A6-441 and which is available via NCBI BioSample SAMN15816927.  
4854 This is a new name for the alphanumeric GTDB species sp900549465. Although GTDB has  
4855 assigned this species to the genus it calls *Fusobacterium\_A*, this genus designation cannot be  
4856 incorporated into a well-formed binomial, so in naming this species, we have used the current  
4857 validly published name for the genus. The GC content of the type genome is 29.86% and the  
4858 genome length is 1.8 Mbp.

4859

4860

4861 **Description of *Candidatus Gallacutalibacter* gen. nov.**

4862 *Candidatus Gallacutalibacter* (Gall.a.cu.ta.li.bac'ter. L. masc. n. *gallus* chicken; N.L. masc. n.  
4863 *Acutalibacter* a genus name; N.L. masc. n. *Gallacutalibacter* a genus related to the genus  
4864 *Acutalibacter* but distinct from it and found in poultry)

4865

4866 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4867 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4868 species *Gallacutalibacter pullicola*. This genus was identified but not named by Glendinning et  
4869 al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
4870 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
4871 *Acutalibacteraceae*.

4872

4873

4874 **Description of *Candidatus Gallacutalibacter pullicola* sp. nov.**

4875 *Candidatus Gallacutalibacter pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
4876 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

4877

4878 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4879 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4880 assigned the MAG ID ChiSjej1B19-7085 and which is available via NCBI BioSample  
4881 SAMN15816935. The GC content of the type genome is 56.02% and the genome length is 2.5  
4882 Mbp.

4883

4884

4885 **Description of *Candidatus Gallacutalibacter pullistercoris* sp. nov.**

4886 *Candidatus Gallacutalibacter pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken;  
4887 L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

4888

4889 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4890 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4891 assigned the MAG ID 13869 and which is available via NCBI BioSample SAMN15816961. The  
4892 GC content of the type genome is 51.21% and the genome length is 2.4 Mbp.

4893

4894

4895 **Description of *Candidatus Gallacutalibacter stercoravium* sp. nov.**

4896 *Candidatus Gallacutalibacter stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
4897 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

4898

4899 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4900 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4901 assigned the MAG ID CHK176-13069 and which is available via NCBI BioSample  
4902 SAMN15816939. The GC content of the type genome is 51.38% and the genome length is 2.7  
4903 Mbp.

4904

4905

4906 **Description of *Candidatus Gallibacteroides* gen. nov.**

4907 *Candidatus Gallibacteroides* (Gal.li.bac.te.ro'i.des. L. masc. n. *gallus* chicken; N.L. masc. n.  
4908 *Bacteroides* a genus name; N.L. masc. n. *Gallibacteroides* a genus related to the genus  
4909 *Bacteroides* but distinct from it and found in poultry)

4910

4911 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4912 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4913 species *Gallibacteroides avistercoris*. This genus has been assigned by GTDB-Tk v1.3.0  
4914 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
4915 *Bacteroidales* and to the family *Barnesiellaceae*.

4916

4917

4918 **Description of *Candidatus Gallibacteroides avistercoris* sp. nov.**

4919 *Candidatus Gallibacteroides avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
4920 dung; N.L. gen. n. *avistercoris* of bird faeces)

4921

4922 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4923 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4924 assigned the MAG ID CHK158-818 and which is available via NCBI BioSample  
4925 SAMN15816984. The GC content of the type genome is 46.12% and the genome length is 2.3  
4926 Mbp.

4927

4928

4929 **Description of *Candidatus Galligastranaerophilus* gen. nov.**

4930 *Candidatus Galligastranaerophilus* (Gal.li.gastr.an.a.e.ro'phi.lus. L. masc. n. *gallus* chicken; N.L.  
4931 masc. n. *Gastranaerophilus* a genus name; N.L. masc. n. *Galligastranaerophilus* a genus related  
4932 to the genus *Gastranaerophilus* but distinct from it and found in poultry)

4933

4934 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4935 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4936 species *Galligastranaerophilus faecipullorum*. This genus has been assigned by GTDB-Tk  
4937 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
4938 order *Gastranaerophilales* and to the family *Gastranaerophilaceae*.

4939

4940

4941 **Description of *Candidatus Galligastranaerophilus faecipullorum* sp. nov.**

4942 *Candidatus Galligastranaerophilus faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis*  
4943 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
4944 faeces)

4945  
4946 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4947 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4948 assigned the MAG ID ChiW23-1657 and which is available via NCBI BioSample  
4949 SAMN15816949. The GC content of the type genome is 39.52% and the genome length is 1.7  
4950 Mbp.

4951

4952

4953 **Description of *Candidatus Galligastranaerophilus gallistercoris* sp. nov.**

4954 *Candidatus Galligastranaerophilus gallistercoris* (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L.  
4955 neut. n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

4956

4957 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4958 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4959 assigned the MAG ID CHK123-4750 and which is available via NCBI BioSample  
4960 SAMN15816963. The GC content of the type genome is 35.45% and the genome length is 1.8  
4961 Mbp.

4962

4963

4964 **Description of *Candidatus Galligastranaerophilus intestinavium* sp. nov.**

4965 *Candidatus Galligastranaerophilus intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L.  
4966 fem. n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

4967

4968 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4969 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4970 assigned the MAG ID CHK152-2871 and which is available via NCBI BioSample  
4971 SAMN15816967. The GC content of the type genome is 35.80% and the genome length is 1.6  
4972 Mbp.

4973

4974

4975 **Description of *Candidatus Galligastranaerophilus intestinigallarum* sp. nov.**

4976 *Candidatus Galligastranaerophilus intestinigallarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n.  
4977 *intestinum* gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

4978

4979 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
4980 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
4981 assigned the MAG ID CHK123-3438 and which is available via NCBI BioSample  
4982 SAMN15816973. The GC content of the type genome is 32.50% and the genome length is 1.7  
4983 Mbp.

4984

4985

4986 **Description of *Candidatus Gallilactobacillus* gen. nov.**

4987 *Candidatus Gallilactobacillus* (Gal.li.lac.to.ba.cil'lus. L. masc. n. *gallus* chicken; N.L. masc. n.  
4988 *Lactobacillus* a genus name; N.L. masc. n. *Gallilactobacillus* a genus related to the genus  
4989 *Lactobacillus* but distinct from it and found in poultry)

4990

4991 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
4992 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
4993 species *Gallilactobacillus intestinavium*. This genus has been assigned by GTDB-Tk v1.3.0  
4994 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
4995 *Lactobacillales* and to the family *Lactobacillaceae*.

4996

4997

4998 **Description of *Candidatus Gallilactobacillus intestinavium* sp. nov.**

4999 *Candidatus Gallilactobacillus intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem.  
5000 n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

5001

5002 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5003 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5004 assigned the MAG ID C6-149 and which is available via NCBI BioSample SAMN15816970.  
5005 The GC content of the type genome is 29.69% and the genome length is 1.2 Mbp.

5006

5007

5008 **Description of *Candidatus Gallimonas gallistercoris* sp. nov.**

5009 *Candidatus Gallimonas gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
5010 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

5011

5012 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5013 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5014 assigned the MAG ID CHK156-179 and which is available via NCBI BioSample  
5015 SAMN15816677. The GC content of the type genome is 58.55% and the genome length is 1.6  
5016 Mbp.

5017

5018

5019 **Description of *Candidatus Gallimonas intestinavium* sp. nov.**

5020 *Candidatus Gallimonas intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
5021 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

5022

5023 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5024 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5025 assigned the MAG ID ChiW7-2402 and which is available via NCBI BioSample  
5026 SAMN15816844. This is a new name for the alphanumeric GTDB species sp003343805. The  
5027 GC content of the type genome is 58.63% and the genome length is 1.8 Mbp.

5028

5029

5030 **Description of *Candidatus Gallimonas intestinigallarum* sp. nov.**

5031 *Candidatus Gallimonas intestinigallarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
5032 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

5033

5034 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5035 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5036 assigned the MAG ID CHK33-5263 and which is available via NCBI BioSample  
5037 SAMN15816692. The GC content of the type genome is 57.82% and the genome length is 1.6  
5038 Mbp.

5039

5040

5041 **Description of *Candidatus Gallipaludibacter* gen. nov.**

5042 *Candidatus Gallipaludibacter* (Gal.li.pa.lu.di.bac'ter. L. masc. n. *gallus* chicken; N.L. masc. n.  
5043 *Paludibacter* a genus name; N.L. masc. n. *Gallipaludibacter* a genus related to the genus  
5044 *Paludibacter* but distinct from it and found in poultry)

5045

5046 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5047 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5048 species *Gallipaludibacter merdavium*. This genus has been assigned by GTDB-Tk v1.3.0  
5049 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
5050 *Bacteroidales* and to the family *Paludibacteraceae*.

5051

5052

5053 **Description of *Candidatus Gallipaludibacter merdavium* sp. nov.**

5054 *Candidatus Gallipaludibacter merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
5055 bird; N.L. gen. n. *merdavium* of bird faeces)

5056

5057 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5058 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5059 assigned the MAG ID G3-3990 and which is available via NCBI BioSample SAMN15816954.  
5060 The GC content of the type genome is 41.91% and the genome length is 2.9 Mbp.

5061

5062

5063 **Description of *Candidatus Gallitreponema* gen. nov.**

5064 *Candidatus Gallitreponema* (Gal.li.tre.po.ne'ma. L. masc. n. *gallus* chicken; N.L. neut. n.  
5065 *Treponema* a genus name; N.L. neut. n. *Gallitreponema* a genus related to the genus *Treponema*  
5066 but distinct from it and found in poultry)

5067

5068 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5069 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5070 species *Gallitreponema excrementavium*. This genus has been assigned by GTDB-Tk v1.3.0  
5071 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
5072 *Treponematales* and to the family *Treponemataceae*.

5073

5074

5075 **Description of *Candidatus Gallitreponema excrementavium* sp. nov.**

5076 *Candidatus Gallitreponema excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
5077 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

5078

5079 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5080 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5081 assigned the MAG ID 10532 and which is available via NCBI BioSample SAMN15816962. The  
5082 GC content of the type genome is 40.13% and the genome length is 2.4 Mbp.

5083  
5084

5085 **Description of *Candidatus Galloscillospira* gen. nov.**

5086 *Candidatus Galloscillospira* (Gall.os.cil.lo.spi'ra. L. masc. n. *gallus* chicken; N.L. fem. n.  
5087 *Oscillospira* a genus name; N.L. fem. n. *Galloscillospira*. a genus related to the genus  
5088 *Oscillospira* but distinct from it and found in poultry)

5089

5090 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5091 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5092 species *Galloscillospira excrementipullorum*. This genus belongs to the new family *Candidatus*  
5093 *Galloscillospiraceae*.

5094

5095

5096 **Description of *Candidatus Galloscillospira excrementavium* sp. nov.**

5097 *Candidatus Galloscillospira excrementavium* (ex.cre.men.ta'vi.um. L. neut. n. *excrementum*  
5098 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

5099

5100 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5101 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5102 assigned the MAG ID ChiSjej1B19-13426 and which is available via NCBI BioSample  
5103 SAMN15816937. The GC content of the type genome is 65.18% and the genome length is 2.1  
5104 Mbp.

5105

5106

5107 **Description of *Candidatus Galloscillospira excrementipullorum* sp. nov.**

5108 *Candidatus Galloscillospira excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
5109 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
5110 young chicken excrement)

5111

5112 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5113 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5114 assigned the MAG ID ChiHjej8B7-10251 and which is available via NCBI BioSample  
5115 SAMN15816946. The GC content of the type genome is 60.78% and the genome length is 1.6  
5116 Mbp.

5117

5118

5119 **Description of *Candidatus Galloscillospira stercoripullorum* sp. nov.**

5120 *Candidatus Galloscillospira stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
5121 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

5122

5123 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5124 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

5125 assigned the MAG ID CHK33-6455 and which is available via NCBI BioSample  
5126 SAMN15816975. The GC content of the type genome is 62.96% and the genome length is 1.9  
5127 Mbp.

5128  
5129

5130 **Description of *Candidatus Galloscillospiraceae* fam. nov.**

5131 *Candidatus Galloscillospiraceae* (Gall.os.cil.lo.spi.ra.ce'ae. N.L. fem. n. *Galloscillospira*. type  
5132 genus of the family genus; N.L. suff. *-ceae* to denote a family; N.L. fem. pl. n.  
5133 *Galloscillospiraceae*, the family of the genus *Galloscillospira*)

5134

5135 A bacterial family identified by metagenomic analyses. This family has been defined by the  
5136 absence of a family assignment for the type species when GTDB-Tk v1.3.0 is applied to GTDB  
5137 Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). GTDB assigns the type species and  
5138 thus the family to the order *Oscillospirales*.

5139

5140

5141 **Description of *Candidatus Gemmiger avicola* sp. nov.**

5142 *Candidatus Gemmiger avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
5143 n. *avicola* inhabitant of birds)

5144

5145 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5146 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5147 assigned the MAG ID ChiBcec8-13705 and which is available via NCBI BioSample  
5148 SAMN15816825. This is a new name for the alphanumeric GTDB species sp900548355. The  
5149 GC content of the type genome is 61.69% and the genome length is 2.3 Mbp.

5150

5151

5152 **Description of *Candidatus Gemmiger avistercoris* sp. nov.**

5153 *Candidatus Gemmiger avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
5154 N.L. gen. n. *avistercoris* of bird faeces)

5155

5156 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5157 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5158 assigned the MAG ID CHK188-11489 and which is available via NCBI BioSample  
5159 SAMN15816604. The GC content of the type genome is 63.30% and the genome length is 2.2  
5160 Mbp.

5161

5162

5163 **Description of *Candidatus Gemmiger avium* sp. nov.**

5164 *Candidatus Gemmiger avium* (a'vi.um. L. fem. pl. n. *avium* of birds)

5165

5166 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5167 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5168 assigned the MAG ID ChiGjej4B4-15321 and which is available via NCBI BioSample  
5169 SAMN15816926. This is a new name for the alphanumeric GTDB species sp002160955.  
5170 Although GTDB has assigned this species to the genus it calls *Gemmiger\_A*, this genus

5171 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
5172 have used the current validly published name for the genus. The GC content of the type genome  
5173 is 62.71% and the genome length is 2.6 Mbp.

5174  
5175

5176 **Description of *Candidatus Gemmiger excrementavium* sp. nov.**

5177 *Candidatus* Gemmiger excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
5178 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

5179

5180 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5181 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5182 assigned the MAG ID 3436 and which is available via NCBI BioSample SAMN15816690. The  
5183 GC content of the type genome is 60.89% and the genome length is 2.5 Mbp.

5184  
5185

5186 **Description of *Candidatus Gemmiger excrementigallinarum* sp. nov.**

5187 *Candidatus* Gemmiger excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
5188 *excrementum* excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementigallinarum* of hen  
5189 excrement)

5190

5191 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5192 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5193 assigned the MAG ID ChiSxjej1B13-11774 and which is available via NCBI BioSample  
5194 SAMN15816691. The GC content of the type genome is 58.73% and the genome length is 2.4  
5195 Mbp.

5196  
5197

5198 **Description of *Candidatus Gemmiger excrementipullorum* sp. nov.**

5199 *Candidatus* Gemmiger excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
5200 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
5201 chicken excrement)

5202

5203 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5204 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5205 assigned the MAG ID ChiHecec2B26-7398 and which is available via NCBI BioSample  
5206 SAMN15816726. The GC content of the type genome is 64.11% and the genome length is 2.1  
5207 Mbp.

5208  
5209

5210 **Description of *Candidatus Gemmiger faecavium* sp. nov.**

5211 *Candidatus* Gemmiger faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
5212 bird; N.L. gen. n. *faecavium* of bird faeces)

5213

5214 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5215 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5216 assigned the MAG ID ChiSxjej1B13-1558 and which is available via NCBI BioSample

5217 SAMN15816740. The GC content of the type genome is 60.04% and the genome length is 2.5  
5218 Mbp.

5219  
5220

5221 **Description of *Candidatus Gemmiger faecigallinarum* sp. nov.**

5222 *Candidatus* Gemmiger faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
5223 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

5224

5225 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5226 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5227 assigned the MAG ID 14795 and which is available via NCBI BioSample SAMN15816795. The  
5228 GC content of the type genome is 63.90% and the genome length is 2.6 Mbp.

5229

5230

5231 **Description of *Candidatus Gemmiger stercoravium* sp. nov.**

5232 *Candidatus* Gemmiger stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
5233 bird; N.L. gen. n. *stercoravium* of bird faeces)

5234

5235 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5236 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5237 assigned the MAG ID ChiBcolR8-2160 and which is available via NCBI BioSample  
5238 SAMN15816579. The GC content of the type genome is 65.46% and the genome length is 2.5  
5239 Mbp.

5240

5241

5242 **Description of *Candidatus Gemmiger stercorigallinarum* sp. nov.**

5243 *Candidatus* Gemmiger stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
5244 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

5245

5246 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5247 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5248 assigned the MAG ID CHK183-27628 and which is available via NCBI BioSample  
5249 SAMN15816586. The GC content of the type genome is 64.08% and the genome length is 2.5  
5250 Mbp.

5251

5252

5253 **Description of *Candidatus Gemmiger stercoripullorum* sp. nov.**

5254 *Candidatus* Gemmiger stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
5255 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

5256

5257 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5258 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5259 assigned the MAG ID ChiSjej4B22-15101 and which is available via NCBI BioSample  
5260 SAMN15816589. The GC content of the type genome is 64.37% and the genome length is 2.2  
5261 Mbp.

5262

5263

**Description of *Candidatus Gordonibacter avicola* sp. nov.**

5264 *Candidatus* Gordonibacter avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of;  
5265 N.L. n. *avicola* inhabitant of birds)

5266

5267  
5268 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5269 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5270 assigned the MAG ID ChiSxjej6B18-1472 and which is available via NCBI BioSample  
5271 SAMN15816757. The GC content of the type genome is 59.91% and the genome length is 3.1  
5272 Mbp.

5273

5274

**Description of *Candidatus Halomonas stercoripullorum* sp. nov.**

5275 *Candidatus* Halomonas stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
5276 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

5277

5278  
5279 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5280 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5281 assigned the MAG ID 1193 and which is available via NCBI BioSample SAMN15816734. The  
5282 GC content of the type genome is 59.74% and the genome length is 2.1 Mbp.

5283

5284

**Description of *Candidatus Helicobacter avicola* sp. nov.**

5285 *Candidatus* Helicobacter avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
5286 n. *avicola* inhabitant of birds)

5287

5288  
5289 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5290 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5291 assigned the MAG ID 14449 and which is available via NCBI BioSample SAMN15816913.  
5292 Although GTDB has assigned this species to the genus it calls *Helicobacter\_F*, this genus  
5293 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
5294 have used the current validly published name for the genus. The GC content of the type genome  
5295 is 42.81% and the genome length is 1.7 Mbp.

5296

5297

**Description of *Candidatus Helicobacter avistercoris* sp. nov.**

5298 *Candidatus* Helicobacter avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
5299 dung; N.L. gen. n. *avistercoris* of bird faeces)

5300

5301

5302 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5303 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5304 assigned the MAG ID CHK158-8274 and which is available via NCBI BioSample  
5305 SAMN15816903. Although GTDB has assigned this species to the genus it calls *Helicobacter\_G*  
5306, this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
5307 species, we have used the current validly published name for the genus. The GC content of the  
5308 type genome is 38.34% and the genome length is 1.4 Mbp.

5309

5310

**Description of *Candidatus Hungatella pullicola* sp. nov.**

5312 *Candidatus* Hungatella pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
5313 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

5314

5315 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5316 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5317 assigned the MAG ID CHK186-17716 and which is available via NCBI BioSample  
5318 SAMN15816620. The GC content of the type genome is 44.57% and the genome length is 2.9  
5319 Mbp.

5320

5321

**Description of *Candidatus Ignatzschineria merdigallarum* sp. nov.**

5323 *Candidatus* Ignatzschineria merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
5324 fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

5325

5326 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5327 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5328 assigned the MAG ID CHK160-9182 and which is available via NCBI BioSample  
5329 SAMN15816769. The GC content of the type genome is 39.66% and the genome length is 2.3  
5330 Mbp.

5331

5332

**Description of *Candidatus Intestinimonas merdavium* sp. nov.**

5334 *Candidatus* Intestinimonas merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
5335 bird; N.L. gen. n. *merdavium* of bird faeces)

5336

5337 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5338 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5339 assigned the MAG ID CHK33-7979 and which is available via NCBI BioSample  
5340 SAMN15816706. The GC content of the type genome is 61.44% and the genome length is 2.4  
5341 Mbp.

5342

5343

**Description of *Candidatus Intestinimonas pullistercoris* sp. nov.**

5345 *Candidatus* Intestinimonas pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
5346 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

5347

5348 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5349 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5350 assigned the MAG ID CHK186-1790 and which is available via NCBI BioSample  
5351 SAMN15816581. The GC content of the type genome is 64.76% and the genome length is 2.4  
5352 Mbp.

5353

5354

5355 **Description of *Candidatus Intestinimonas stercoravium* sp. nov.**

5356 *Candidatus Intestinimonas stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
5357 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

5358

5359 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5360 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5361 assigned the MAG ID ChiBcolR2-622 and which is available via NCBI BioSample  
5362 SAMN15816599. The GC content of the type genome is 65.33% and the genome length is 2.2  
5363 Mbp.

5364

5365

5366 **Description of *Candidatus Intestinimonas stercorigallinarum* sp. nov.**

5367 *Candidatus Intestinimonas stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
5368 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

5369

5370 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5371 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5372 assigned the MAG ID ChiSxjej2B14-1745 and which is available via NCBI BioSample  
5373 SAMN15816719. The GC content of the type genome is 65.69% and the genome length is 2.1  
5374 Mbp.

5375

5376

5377 **Description of *Candidatus Janibacter merdipullorum* sp. nov.**

5378 *Candidatus Janibacter merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
5379 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

5380

5381 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5382 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5383 assigned the MAG ID ChiHjej13B12-21492 and which is available via NCBI BioSample  
5384 SAMN15816685. The GC content of the type genome is 71.49% and the genome length is 2.8  
5385 Mbp.

5386

5387

5388 **Description of *Candidatus Jeotgalibaca merdavium* sp. nov.**

5389 *Candidatus Jeotgalibaca merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
5390 N.L. gen. n. *merdavium* of bird faeces)

5391

5392 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5393 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5394 assigned the MAG ID CHK171-505 and which is available via NCBI BioSample  
5395 SAMN15816828. This is a new name for the alphanumeric GTDB species sp001975685. The  
5396 GC content of the type genome is 38.39% and the genome length is 2.0 Mbp.

5397

5398

5399 **Description of *Candidatus Jeotgalibaca pullicola* sp. nov.**

5400 *Candidatus* Jeotgalibaca pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
5401 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

5402  
5403 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5404 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5405 assigned the MAG ID CHK172-9797 and which is available via NCBI BioSample  
5406 SAMN15816826. This is a new name for the alphanumeric GTDB species sp003955755. The  
5407 GC content of the type genome is 36.93% and the genome length is 2.6 Mbp.

5408  
5409

5410 **Description of *Candidatus* Jeotgalicoccus stercoravium sp. nov.**

5411 *Candidatus* Jeotgalicoccus stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
5412 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

5413

5414 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5415 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5416 assigned the MAG ID CHK148-7025 and which is available via NCBI BioSample  
5417 SAMN15816765. The GC content of the type genome is 36.17% and the genome length is 1.7  
5418 Mbp.

5419  
5420

5421 **Description of *Candidatus* Kurthia intestinigallarum sp. nov.**

5422 *Candidatus* Kurthia intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.  
5423 fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

5424

5425 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5426 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5427 assigned the MAG ID CHK171-3164 and which is available via NCBI BioSample  
5428 SAMN15816863. This is a new name for the alphanumeric GTDB species sp002418445. The  
5429 GC content of the type genome is 39.62% and the genome length is 2.9 Mbp.

5430  
5431

5432 **Description of *Candidatus* Lachnoclostridium avicola sp. nov.**

5433 *Candidatus* Lachnoclostridium avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant  
5434 of; N.L. n. *avicola* inhabitant of birds)

5435

5436 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5437 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5438 assigned the MAG ID CHK190-19777 and which is available via NCBI BioSample  
5439 SAMN15816889. Although GTDB has assigned this species to the genus it calls  
5440 *Lachnoclostridium\_A*, this genus designation cannot be incorporated into a well-formed  
5441 binomial, so in naming this species, we have used the current validly published name for the  
5442 genus. The GC content of the type genome is 54.75% and the genome length is 2.9 Mbp.

5443  
5444

5445 **Description of *Candidatus* Lachnoclostridium pullistercoris sp. nov.**

5446 *Candidatus* Lachnospirillum pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young  
5447 chicken; L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

5448  
5449 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5450 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5451 assigned the MAG ID CHK183-5548 and which is available via NCBI BioSample  
5452 SAMN15816884. Although GTDB has assigned this species to the genus it calls  
5453 Lachnospirillum\_A , this genus designation cannot be incorporated into a well-formed  
5454 binomial, so in naming this species, we have used the current validly published name for the  
5455 genus. The GC content of the type genome is 54.35% and the genome length is 2.8 Mbp.

5456  
5457

5458 **Description of *Candidatus* Lachnospirillum stercoravium sp. nov.**

5459 *Candidatus* Lachnospirillum stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
5460 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

5461  
5462 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5463 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5464 assigned the MAG ID CHK178-16964 and which is available via NCBI BioSample  
5465 SAMN15816887. Although GTDB has assigned this species to the genus it calls  
5466 Lachnospirillum\_A , this genus designation cannot be incorporated into a well-formed  
5467 binomial, so in naming this species, we have used the current validly published name for the  
5468 genus. The GC content of the type genome is 49.55% and the genome length is 3.0 Mbp.

5469  
5470

5471 **Description of *Candidatus* Lachnospirillum stercorigallinarum sp. nov.**

5472 *Candidatus* Lachnospirillum stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
5473 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

5474  
5475 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5476 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5477 assigned the MAG ID ChiBcec1-1093 and which is available via NCBI BioSample  
5478 SAMN15816897. Although GTDB has assigned this species to the genus it calls  
5479 Lachnospirillum\_A , this genus designation cannot be incorporated into a well-formed  
5480 binomial, so in naming this species, we have used the current validly published name for the  
5481 genus. The GC content of the type genome is 54.29% and the genome length is 2.4 Mbp.

5482  
5483

5484 **Description of *Candidatus* Lachnospirillum stercoripullorum sp. nov.**

5485 *Candidatus* Lachnospirillum stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung;  
5486 L. masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young  
5487 chickens)

5488  
5489

5490 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5491 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5492 assigned the MAG ID ChiGjej4B4-12881 and which is available via NCBI BioSample

5492 SAMN15816908. Although GTDB has assigned this species to the genus it calls  
5493 *Lachnoclostridium\_A*, this genus designation cannot be incorporated into a well-formed  
5494 binomial, so in naming this species, we have used the current validly published name for the  
5495 genus. The GC content of the type genome is 59.38% and the genome length is 2.3 Mbp.

5496  
5497

5498 **Description of *Candidatus Lactobacillus pullistercoris* sp. nov.**

5499 *Candidatus Lactobacillus pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
5500 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

5501

5502 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5503 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5504 assigned the MAG ID F6-686 and which is available via NCBI BioSample SAMN15816686.  
5505 The GC content of the type genome is 34.54% and the genome length is 1.7 Mbp.

5506  
5507

5508 **Description of *Candidatus Lawsonibacter pullicola* sp. nov.**

5509 *Candidatus Lawsonibacter pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
5510 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

5511

5512 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5513 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5514 assigned the MAG ID CHK178-3907 and which is available via NCBI BioSample  
5515 SAMN15816869. This is a new name for the alphanumeric GTDB species sp002160305. The  
5516 GC content of the type genome is 62.98% and the genome length is 2.3 Mbp.

5517

5518

5519 **Description of *Candidatus Levilactobacillus faecigallinarum* sp. nov.**

5520 *Candidatus Levilactobacillus faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
5521 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

5522

5523 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5524 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5525 assigned the MAG ID CHK173-259 and which is available via NCBI BioSample  
5526 SAMN15816755. The GC content of the type genome is 52.18% and the genome length is 1.8  
5527 Mbp.

5528

5529

5530 **Description of *Candidatus Ligilactobacillus avistercoris* sp. nov.**

5531 *Candidatus Ligilactobacillus avistercoris* (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
5532 dung; N.L. gen. n. *avistercoris* of bird faeces)

5533

5534 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5535 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5536 assigned the MAG ID ChiBile7-59 and which is available via NCBI BioSample

5537 SAMN15816642. The GC content of the type genome is 51.08% and the genome length is 1.2  
5538 Mbp.

5539

5540

5541 **Description of *Candidatus Ligilactobacillus excrementavium* sp. nov.**

5542 *Candidatus Ligilactobacillus excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
5543 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

5544

5545 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5546 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5547 assigned the MAG ID 2259 and which is available via NCBI BioSample SAMN15816683. The  
5548 GC content of the type genome is 38.00% and the genome length is 1.9 Mbp.

5549

5550

5551 **Description of *Candidatus Ligilactobacillus excrementigallinarum* sp. nov.**

5552 *Candidatus Ligilactobacillus excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
5553 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
5554 excrement)

5555

5556 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5557 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5558 assigned the MAG ID 6627 and which is available via NCBI BioSample SAMN15816741. The  
5559 GC content of the type genome is 34.16% and the genome length is 1.2 Mbp.

5560

5561

5562 **Description of *Candidatus Ligilactobacillus excrementipullorum* sp. nov.**

5563 *Candidatus Ligilactobacillus excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
5564 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
5565 young chicken excrement)

5566

5567 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5568 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5569 assigned the MAG ID CHK171-2193 and which is available via NCBI BioSample

5570 SAMN15816749. The GC content of the type genome is 42.06% and the genome length is 2.0

5571 Mbp.

5572

5573

5574 **Description of *Candidatus Ligilactobacillus faecavium* sp. nov.**

5575 *Candidatus Ligilactobacillus faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem.  
5576 n. *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

5577

5578 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5579 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5580 assigned the MAG ID 3439 and which is available via NCBI BioSample SAMN15816798. The  
5581 GC content of the type genome is 40.05% and the genome length is 1.3 Mbp.

5582

5583

**Description of *Candidatus Limadaptatus* gen. nov.**

5584 *Candidatus* Limadaptatus (Lim.adaptatus. L. masc. n. *limus* dung; L. past part. masc. *adaptatus*  
5585 adapted to; N.L. masc. n. *Limadaptatus* a microbe associated with faeces)

5586

5587  
5588 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5589 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5590 species *Limadaptatus stercoripullorum*. This is a name for the alphanumeric GTDB genus  
5591 UMG51688. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
5592 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
5593 *CAG-917*.

5594

5595

**Description of *Candidatus Limadaptatus stercoravium* sp. nov.**

5596 *Candidatus* Limadaptatus stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
5597 bird; N.L. gen. n. *stercoravium* of bird faeces)

5598

5599  
5600 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5601 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5602 assigned the MAG ID CHK154-227 and which is available via NCBI BioSample  
5603 SAMN15817097. The GC content of the type genome is 58.03% and the genome length is 1.4  
5604 Mbp.

5605

5606

**Description of *Candidatus Limadaptatus stercorigallarum* sp. nov.**

5607 *Candidatus* Limadaptatus stercorigallarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
5608 fem. n. *gallina* hen; N.L. gen. n. *stercorigallarum* of hen faeces)

5609

5610  
5611 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5612 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5613 assigned the MAG ID 1063 and which is available via NCBI BioSample SAMN15817231. This  
5614 is a new name for the alphanumeric GTDB species sp900544575. The GC content of the type  
5615 genome is 56.41% and the genome length is 1.5 Mbp.

5616

5617

**Description of *Candidatus Limadaptatus stercoripullorum* sp. nov.**

5618 *Candidatus* Limadaptatus stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
5619 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

5620

5621  
5622 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5623 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5624 assigned the MAG ID 10406 and which is available via NCBI BioSample SAMN15817154. The  
5625 GC content of the type genome is 61.19% and the genome length is 1.4 Mbp.

5626

5627

**Description of *Candidatus Limenecus* gen. nov.**

5628

5629 *Candidatus Limenecus* (Lim.en.e'cus. L. masc. n. *limus* dung; Gr. masc. *enoikos* inhabitant; N.L.  
5630 masc. n. *Limenecus* a microbe associated with faeces)

5631  
5632 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5633 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5634 species *Limenecus avicola*. This is a name for the alphanumeric GTDB genus CAG-306. This  
5635 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
5636 al., 2019; Parks et al., 2020) to the order *Gastranaerophilales* and to the family  
5637 *Gastranaerophilaceae*.

5638  
5639

5640 **Description of *Candidatus Limenecus avicola* sp. nov.**

5641 *Candidatus Limenecus avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
5642 n. *avicola* inhabitant of birds)

5643  
5644 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5645 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5646 assigned the MAG ID CHK154-7741 and which is available via NCBI BioSample  
5647 SAMN15817206. This is a new name for the alphanumeric GTDB species sp000980375. The  
5648 GC content of the type genome is 36.63% and the genome length is 2.1 Mbp.

5649  
5650

5651 **Description of *Candidatus Limicola* gen. nov.**

5652 *Candidatus Limicola* (Lim.i.co'la. L. masc. n. *limus* dung; L. suff. *-cola* inhabitant of; N.L. fem.  
5653 n. *Limicola* a microbe associated with faeces)

5654  
5655 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5656 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5657 species *Limicola stercorigallinarum*. This is a name for the alphanumeric GTDB genus An2-A.  
5658 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
5659 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Coriobacteriales* and to the family  
5660 *Coriobacteriaceae*.

5661  
5662

5663 **Description of *Candidatus Limicola stercorigallinarum* sp. nov.**

5664 *Candidatus Limicola stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L. fem.  
5665 n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

5666  
5667 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5668 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5669 assigned the MAG ID ChiGjej1B1-16188 and which is available via NCBI BioSample  
5670 SAMN15817082. The GC content of the type genome is 60.48% and the genome length is 2.0  
5671 Mbp.

5672  
5673

5674 **Description of *Candidatus Limihabitans* gen. nov.**

5675 *Candidatus* Limihabitans (Lim.i.hab.it'ans. L. masc. n. *limus* dung; L. pres. part. *habitans* an  
5676 inhabitant; N.L. fem. n. *Limihabitans* a microbe associated with faeces)

5677

5678 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5679 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5680 species *Limihabitans stercoravium*. This is a name for the alphanumeric GTDB genus  
5681 UMGS1707. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
5682 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *4C28d-15* and to the family *CAG-*  
5683 *314*.

5684

5685

5686 **Description of *Candidatus* Limihabitans stercoravium sp. nov.**

5687 *Candidatus* Limihabitans stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
5688 bird; N.L. gen. n. *stercoravium* of bird faeces)

5689

5690 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5691 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5692 assigned the MAG ID 3394 and which is available via NCBI BioSample SAMN15817227. This  
5693 is a new name for the alphanumeric GTDB species sp900547645. The GC content of the type  
5694 genome is 43.23% and the genome length is 1.6 Mbp.

5695

5696

5697 **Description of *Candidatus* Limimorpha gen. nov.**

5698 *Candidatus* Limimorpha (Lim.i.mor'pha. L. masc. n. *limus* dung; Gr. fem. n. *morphe* a form,  
5699 shape; N.L. fem. n. *Limimorpha* a microbe associated with faeces)

5700

5701 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5702 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5703 species *Limimorpha avicola*. This is a name for the alphanumeric GTDB genus F082. This genus  
5704 has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al.,  
5705 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family *F082*.

5706

5707

5708 **Description of *Candidatus* Limimorpha avicola sp. nov.**

5709 *Candidatus* Limimorpha avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
5710 n. *avicola* inhabitant of birds)

5711

5712 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5713 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5714 assigned the MAG ID Gambia15-481 and which is available via NCBI BioSample  
5715 SAMN15817194. This is a new name for the alphanumeric GTDB species sp002633315. The  
5716 GC content of the type genome is 38.09% and the genome length is 2.5 Mbp.

5717

5718

5719 **Description of *Candidatus* Limiplasma gen. nov.**

5720 *Candidatus* Limiplasma (Lim.i.plas'ma. L. masc. n. *limus* dung; Gr. neut. n. *plasma* a form; N.L.  
5721 neut. n. *Limiplasma* a microbe associated with faeces)

5722  
5723 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5724 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5725 species *Limiplasma pullicola*. This is a name for the alphanumeric GTDB genus Firm-11. This  
5726 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
5727 al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family *CAG-74*.

5728  
5729

5730 **Description of *Candidatus* Limiplasma merdipullorum sp. nov.**

5731 *Candidatus* Limiplasma merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
5732 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

5733

5734 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5735 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5736 assigned the MAG ID ChiBcec16-3123 and which is available via NCBI BioSample  
5737 SAMN15817217. This is a new name for the alphanumeric GTDB species sp900540045. The  
5738 GC content of the type genome is 61.78% and the genome length is 2.6 Mbp.

5739  
5740

5741 **Description of *Candidatus* Limiplasma pullicola sp. nov.**

5742 *Candidatus* Limiplasma pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
5743 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

5744

5745 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5746 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5747 assigned the MAG ID 2223 and which is available via NCBI BioSample SAMN15817092. The  
5748 GC content of the type genome is 62.99% and the genome length is 2.7 Mbp.

5749  
5750

5751 **Description of *Candidatus* Limiplasma pullistercoris sp. nov.**

5752 *Candidatus* Limiplasma pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
5753 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

5754

5755 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5756 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5757 assigned the MAG ID ChiBcec15-2748 and which is available via NCBI BioSample  
5758 SAMN15817228. This is a new name for the alphanumeric GTDB species sp900553905. The  
5759 GC content of the type genome is 62.75% and the genome length is 2.8 Mbp.

5760  
5761

5762 **Description of *Candidatus* Limiplasma stercoravium sp. nov.**

5763 *Candidatus* Limiplasma stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
5764 bird; N.L. gen. n. *stercoravium* of bird faeces)

5765

5766 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5767 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5768 assigned the MAG ID CHK169-20388 and which is available via NCBI BioSample  
5769 SAMN15817129. The GC content of the type genome is 62.11% and the genome length is 2.4  
5770 Mbp.

5771  
5772

5773 **Description of *Candidatus Limisoma* gen. nov.**

5774 *Candidatus Limisoma* (Lim.i.so'ma. L. masc. n. *limus* dung; Gr. neut. n. *soma* a body; N.L. neut.  
5775 n. *Limisoma* a microbe associated with faeces)

5776

5777 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5778 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5779 species *Limisoma faecipullorum*. This is a name for the alphanumeric GTDB genus CAG-279.  
5780 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
5781 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family  
5782 *Muribaculaceae*.

5783

5784

5785 **Description of *Candidatus Limisoma faecipullorum* sp. nov.**

5786 *Candidatus Limisoma faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
5787 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

5788

5789 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5790 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5791 assigned the MAG ID 6919 and which is available via NCBI BioSample SAMN15817069. The  
5792 GC content of the type genome is 45.95% and the genome length is 2.2 Mbp.

5793

5794

5795 **Description of *Candidatus Limisoma gallistercoris* sp. nov.**

5796 *Candidatus Limisoma gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
5797 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

5798

5799 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5800 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5801 assigned the MAG ID CHK136-1475 and which is available via NCBI BioSample  
5802 SAMN15817174. This is a new name for the alphanumeric GTDB species sp900550025. The  
5803 GC content of the type genome is 48.31% and the genome length is 2.2 Mbp.

5804

5805

5806 **Description of *Candidatus Limisoma intestinavium* sp. nov.**

5807 *Candidatus Limisoma intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n. *avis*  
5808 bird; N.L. gen. n. *intestinavium* of the gut of birds)

5809

5810 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5811 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

5812 assigned the MAG ID 17073 and which is available via NCBI BioSample SAMN15817199. This  
5813 is a new name for the alphanumeric GTDB species sp900541555. The GC content of the type  
5814 genome is 48.25% and the genome length is 1.8 Mbp.

5815  
5816

5817 **Description of *Candidatus Limivicinus* gen. nov.**

5818 *Candidatus Limivicinus* (Lim.i.vic.in'us. L. masc. n. *limus* dung; L. masc. n. *vicinus* a neighbour;  
5819 N.L. masc. n. *Limivicinus* a microbe associated with faeces)

5820

5821 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5822 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5823 species *Limivicinus faecipullorum*. This is a name for the alphanumeric GTDB genus UBA1777.  
5824 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
5825 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
5826 *Oscillospiraceae*.

5827

5828

5829 **Description of *Candidatus Limivicinus faecipullorum* sp. nov.**

5830 *Candidatus Limivicinus faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
5831 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

5832

5833 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5834 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5835 assigned the MAG ID ChiHcec3-8852 and which is available via NCBI BioSample  
5836 SAMN15817081. The GC content of the type genome is 58.52% and the genome length is 1.9  
5837 Mbp.

5838

5839

5840 **Description of *Candidatus Limivivens* gen. nov.**

5841 *Candidatus Limivivens* (Lim.i.viv'ens. L. masc. n. *limus* dung; N.L. pres. part. *vivens* living;  
5842 N.L. fem. n. *Limivivens* a microbe associated with faeces)

5843

5844 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5845 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5846 species *Limivivens intestinipullorum*. This is a name for the alphanumeric GTDB genus GCA-  
5847 900066135. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
5848 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
5849 *Lachnospiraceae*.

5850

5851

5852 **Description of *Candidatus Limivivens intestinipullorum* sp. nov.**

5853 *Candidatus Limivivens intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
5854 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

5855

5856 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5857 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

5858 assigned the MAG ID CHK190-19873 and which is available via NCBI BioSample  
5859 SAMN15817025. The GC content of the type genome is 52.58% and the genome length is 3.4  
5860 Mbp.

5861  
5862

5863 **Description of *Candidatus Limivivens merdigallarum* sp. nov.**

5864 *Candidatus* Limivivens merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
5865 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

5866

5867 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5868 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5869 assigned the MAG ID ChiSje3B21-11622 and which is available via NCBI BioSample  
5870 SAMN15817007. The GC content of the type genome is 50.09% and the genome length is 3.3  
5871 Mbp.

5872

5873

5874 **Description of *Candidatus Limosilactobacillus excrementigallarum* sp. nov.**

5875 *Candidatus* Limosilactobacillus excrementigallarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
5876 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
5877 excrement)

5878

5879 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5880 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5881 assigned the MAG ID 2685 and which is available via NCBI BioSample SAMN15816672. The  
5882 GC content of the type genome is 41.67% and the genome length is 1.4 Mbp.

5883

5884

5885 **Description of *Candidatus Limosilactobacillus faecipullorum* sp. nov.**

5886 *Candidatus* Limosilactobacillus faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis*  
5887 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
5888 faeces)

5889

5890 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5891 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5892 assigned the MAG ID 7774 and which is available via NCBI BioSample SAMN15816663. The  
5893 GC content of the type genome is 43.03% and the genome length is 1.5 Mbp.

5894

5895

5896 **Description of *Candidatus Limosilactobacillus gallistercoris* sp. nov.**

5897 *Candidatus* Limosilactobacillus gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L.  
5898 neut. n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

5899

5900 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5901 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5902 assigned the MAG ID CHK158-2993 and which is available via NCBI BioSample

5903 SAMN15816598. The GC content of the type genome is 52.74% and the genome length is 1.2  
5904 Mbp.

5905  
5906

5907 **Description of *Candidatus Limosilactobacillus intestinavium* sp. nov.**

5908 *Candidatus* Limosilactobacillus intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L.  
5909 fem. n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

5910

5911 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5912 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5913 assigned the MAG ID 2331 and which is available via NCBI BioSample SAMN15816838. This  
5914 is a new name for the alphanumeric GTDB species sp900557215. The GC content of the type  
5915 genome is 38.77% and the genome length is 1.5 Mbp.

5916

5917

5918 **Description of *Candidatus Limosilactobacillus intestinigallinarum* sp. nov.**

5919 *Candidatus* Limosilactobacillus intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n.  
5920 *intestinum* gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

5921

5922 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5923 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5924 assigned the MAG ID CHK176-5070 and which is available via NCBI BioSample  
5925 SAMN15816600. The GC content of the type genome is 54.91% and the genome length is 1.5  
5926 Mbp.

5927

5928

5929 **Description of *Candidatus Limosilactobacillus intestinipullorum* sp. nov.**

5930 *Candidatus* Limosilactobacillus intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum*  
5931 gut; L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young  
5932 chickens)

5933

5934 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5935 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5936 assigned the MAG ID ChiHecolR2B26-165 and which is available via NCBI BioSample  
5937 SAMN15816601. The GC content of the type genome is 49.12% and the genome length is 1.6  
5938 Mbp.

5939

5940

5941 **Description of *Candidatus Limosilactobacillus merdavium* sp. nov.**

5942 *Candidatus* Limosilactobacillus merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n.  
5943 *avis* bird; N.L. gen. n. *merdavium* of bird faeces)

5944

5945 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5946 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5947 assigned the MAG ID 876 and which is available via NCBI BioSample SAMN15816723. The  
5948 GC content of the type genome is 39.60% and the genome length is 1.4 Mbp.

5949

5950

**Description of *Candidatus Limosilactobacillus merdigallarum* sp. nov.**5952 *Candidatus* Limosilactobacillus merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces;5953 L. fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

5954

5955 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5956 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5957 assigned the MAG ID ChiSxjej3B15-572 and which is available via NCBI BioSample  
5958 SAMN15816736. The GC content of the type genome is 44.36% and the genome length is 1.4  
5959 Mbp.

5960

5961

**Description of *Candidatus Limosilactobacillus merdipullorum* sp. nov.**5962 *Candidatus* Limosilactobacillus merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L.5963 masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

5965

5966 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5967 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5968 assigned the MAG ID ChiHejej3B27-2180 and which is available via NCBI BioSample  
5969 SAMN15816756. The GC content of the type genome is 49.90% and the genome length is 1.3  
5970 Mbp.

5971

5972

**Description of *Candidatus Limousia* gen. nov.**5974 *Candidatus* Limousia (Lim.ou'si.a. L. masc. n. *limus* dung; Gr. fem. n. *ousia* an essence; N.L.5975 fem. n. *Limousia* a microbe associated with faeces)

5976

5977 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
5978 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
5979 species *Limousia pullorum*. This is a name for the alphanumeric GTDB genus An172. This  
5980 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
5981 al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Acutalibacteraceae*.

5982

5983

**Description of *Candidatus Limousia pullorum* sp. nov.**5985 *Candidatus* Limousia pullorum (pul.lo'rum. L. gen.pl. n. *pullorum* of young chickens)

5986

5987 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
5988 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
5989 assigned the MAG ID ChiGjej1B1-1684 and which is available via NCBI BioSample  
5990 SAMN15817202. This is a new name for the alphanumeric GTDB species sp002160515. The  
5991 GC content of the type genome is 40.91% and the genome length is 1.7 Mbp.

5992

5993

**Description of *Candidatus Luteimonas excrementigallarum* sp. nov.**

5994

5995 *Candidatus* Luteimonas excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
5996 excrementum excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
5997 excrement)

5998  
5999 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6000 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6001 assigned the MAG ID CHK165-14161 and which is available via NCBI BioSample  
6002 SAMN15816707. The GC content of the type genome is 68.39% and the genome length is 2.5  
6003 Mbp.

6004  
6005

6006 **Description of *Candidatus* Luteococcus avicola sp. nov.**

6007 *Candidatus* Luteococcus avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
6008 n. *avicola* inhabitant of birds)

6009

6010 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6011 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6012 assigned the MAG ID 4979 and which is available via NCBI BioSample SAMN15816867. This  
6013 is a new name for the alphanumeric GTDB species sp002387005. The GC content of the type  
6014 genome is 68.14% and the genome length is 2.9 Mbp.

6015  
6016

6017 **Description of *Candidatus* Mailhella excrementigallinarum sp. nov.**

6018 *Candidatus* Mailhella excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n. *excrementum*  
6019 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen excrement)

6020

6021 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6022 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6023 assigned the MAG ID 708 and which is available via NCBI BioSample SAMN15816871. This is  
6024 a new name for the alphanumeric GTDB species sp003150275. The GC content of the type  
6025 genome is 60.07% and the genome length is 3.0 Mbp.

6026  
6027

6028 **Description of *Candidatus* Mailhella merdavium sp. nov.**

6029 *Candidatus* Mailhella merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
6030 N.L. gen. n. *merdavium* of bird faeces)

6031

6032 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6033 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6034 assigned the MAG ID ChiBcec6-11642 and which is available via NCBI BioSample  
6035 SAMN15816648. The GC content of the type genome is 56.49% and the genome length is 2.7  
6036 Mbp.

6037  
6038

6039 **Description of *Candidatus* Mailhella merdigallinarum sp. nov.**

6040 *Candidatus* Mailhella merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem. n.  
6041 *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

6042  
6043 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6044 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6045 assigned the MAG ID CHK186-16707 and which is available via NCBI BioSample  
6046 SAMN15816842. This is a new name for the alphanumeric GTDB species sp900541395. The  
6047 GC content of the type genome is 61.96% and the genome length is 2.4 Mbp.

6048  
6049

6050 **Description of *Candidatus* Massiliomicrobiota merdigallarum sp. nov.**

6051 *Candidatus* Massiliomicrobiota merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces;  
6052 L. fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

6053

6054 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6055 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6056 assigned the MAG ID CHK183-8118 and which is available via NCBI BioSample  
6057 SAMN15816832. This is a new name for the alphanumeric GTDB species sp002160815. The  
6058 GC content of the type genome is 31.33% and the genome length is 2.4 Mbp.

6059  
6060

6061 **Description of *Candidatus* Mediterraneibacter avicola sp. nov.**

6062 *Candidatus* Mediterraneibacter avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant  
6063 of; N.L. n. *avicola* inhabitant of birds)

6064

6065 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6066 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6067 assigned the MAG ID ChiGjej3B3-8055 and which is available via NCBI BioSample  
6068 SAMN15816612. The GC content of the type genome is 48.65% and the genome length is 2.4  
6069 Mbp.

6070  
6071

6072 **Description of *Candidatus* Mediterraneibacter caccavium sp. nov.**

6073 *Candidatus* Mediterraneibacter caccavium (cacc.a'vi.um. Gr. fem. n. *kakke* faeces; L. fem. n. *avis*  
6074 bird; N.L. gen. n. *caccavium* of bird faeces)

6075

6076 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6077 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6078 assigned the MAG ID ChiSjej5B23-15282 and which is available via NCBI BioSample  
6079 SAMN15816861. This is a new name for the alphanumeric GTDB species sp002161355. The  
6080 GC content of the type genome is 51.40% and the genome length is 2.6 Mbp.

6081  
6082

6083 **Description of *Candidatus* Mediterraneibacter caccogallarum sp. nov.**

6084 *Candidatus* Mediterraneibacter caccogallarum (cac.co.gal.li.na'rum. Gr. fem. n. *kakke* faeces;  
6085 L. fem. n. *gallina* hen; N.L. gen. n. *caccogallarum* of hen faeces)

6086

6087 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6088 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6089 assigned the MAG ID ChiHcolR18-251 and which is available via NCBI BioSample  
6090 SAMN15816801. This is a new name for the alphanumeric GTDB species sp002314255. The  
6091 GC content of the type genome is 50.75% and the genome length is 2.6 Mbp.

6092

6093

6094 **Description of *Candidatus Mediterraneibacter colneyensis* sp. nov.**

6095 *Candidatus* Mediterraneibacter colneyensis (col.ney.en'sis. N.L. fem. adj. *colneyensis* pertaining  
6096 to Colney, the Norfolk village which is home to the Quadram Institute where the species was  
6097 first described)

6098

6099 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6100 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6101 assigned the MAG ID ChiGjej5B5-19924 and which is available via NCBI BioSample  
6102 SAMN15816732. The GC content of the type genome is 50.96% and the genome length is 1.9  
6103 Mbp.

6104

6105

6106 **Description of *Candidatus Mediterraneibacter cottocaccae* sp. nov.**

6107 *Candidatus* Mediterraneibacter cottocaccae (cot.to.cac'cae. Gr. masc. n. *kottos* chicken Gr. fem.  
6108 n. *kakke* faeces; N.L. gen. n. *cottocaccae* of chicken faeces)

6109

6110 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6111 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6112 assigned the MAG ID CHK192-87 and which is available via NCBI BioSample  
6113 SAMN15816835. This is a new name for the alphanumeric GTDB species sp002160525. The  
6114 GC content of the type genome is 50.07% and the genome length is 4.0 Mbp.

6115

6116

6117 **Description of *Candidatus Mediterraneibacter excrementavium* sp. nov.**

6118 *Candidatus* Mediterraneibacter excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
6119 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

6120

6121 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6122 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6123 assigned the MAG ID ChiGjej2B2-38138 and which is available via NCBI BioSample  
6124 SAMN15816630. The GC content of the type genome is 51.42% and the genome length is 2.1  
6125 Mbp.

6126

6127

6128 **Description of *Candidatus Mediterraneibacter excrementigallarum* sp. nov.**

6129 *Candidatus* Mediterraneibacter excrementigallarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
6130 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
6131 excrement)

6132

6133 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6134 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6135 assigned the MAG ID CHK143-6153 and which is available via NCBI BioSample  
6136 SAMN15816575. The GC content of the type genome is 48.97% and the genome length is 3.1  
6137 Mbp.

6138

6139

6140 **Description of *Candidatus Mediterraneibacter excrementipullorum* sp. nov.**

6141 *Candidatus* Mediterraneibacter excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
6142 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
6143 young chicken excrement)

6144

6145 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6146 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6147 assigned the MAG ID ChiSjej6B24-3024 and which is available via NCBI BioSample  
6148 SAMN15816810. This is a new name for the alphanumeric GTDB species sp9005552. The GC  
6149 content of the type genome is 48.88% and the genome length is 2.4 Mbp.

6150

6151

6152 **Description of *Candidatus Mediterraneibacter faecavium* sp. nov.**

6153 *Candidatus* Mediterraneibacter faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L.  
6154 fem. n. *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

6155

6156 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6157 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6158 assigned the MAG ID CHK196-7946 and which is available via NCBI BioSample  
6159 SAMN15816577. The GC content of the type genome is 49.45% and the genome length is 2.8  
6160 Mbp.

6161

6162

6163 **Description of *Candidatus Mediterraneibacter faecigallarum* sp. nov.**

6164 *Candidatus* Mediterraneibacter faecigallarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
6165 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

6166

6167 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6168 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6169 assigned the MAG ID ChiGjej1B1-1692 and which is available via NCBI BioSample  
6170 SAMN15816637. The GC content of the type genome is 51.63% and the genome length is 2.6  
6171 Mbp.

6172

6173

6174 **Description of *Candidatus Mediterraneibacter faecipullorum* sp. nov.**

6175 *Candidatus* Mediterraneibacter faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis*  
6176 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
6177 faeces)

6178

6179 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6180 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6181 assigned the MAG ID ChiW19-954 and which is available via NCBI BioSample  
6182 SAMN15816638. The GC content of the type genome is 47.71% and the genome length is 2.7  
6183 Mbp.

6184

6185

6186 **Description of *Candidatus Mediterraneibacter gallistercoris* sp. nov.**

6187 *Candidatus* Mediterraneibacter gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L.  
6188 neut. n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

6189

6190 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6191 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6192 assigned the MAG ID CHK165-2605 and which is available via NCBI BioSample  
6193 SAMN15816636. The GC content of the type genome is 47.20% and the genome length is 2.5  
6194 Mbp.

6195

6196

6197 **Description of *Candidatus Mediterraneibacter guildfordensis* sp. nov.**

6198 *Candidatus* Mediterraneibacter guildfordensis (guild.ford.en'sis. N.L. fem. adj. *guildfordensis*  
6199 pertaining to Guildford, English town that is home to the University of Surrey)

6200

6201 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6202 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6203 assigned the MAG ID ChiHcec3-18395 and which is available via NCBI BioSample  
6204 SAMN15816784. The GC content of the type genome is 52.47% and the genome length is 2.2  
6205 Mbp.

6206

6207

6208 **Description of *Candidatus Mediterraneibacter intestinavium* sp. nov.**

6209 *Candidatus* Mediterraneibacter intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L.  
6210 fem. n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

6211

6212 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6213 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6214 assigned the MAG ID ChiBcec12-2655 and which is available via NCBI BioSample  
6215 SAMN15816591. The GC content of the type genome is 50.53% and the genome length is 2.9  
6216 Mbp.

6217

6218

6219 **Description of *Candidatus Mediterraneibacter intestinigallarum* sp. nov.**

6220 *Candidatus* Mediterraneibacter intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n.  
6221 *intestinum* gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

6222

6223 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6224 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6225 assigned the MAG ID ChiBcec15-2237 and which is available via NCBI BioSample  
6226 SAMN15816645. The GC content of the type genome is 46.81% and the genome length is 3.1  
6227 Mbp.

6228  
6229

6230 **Description of *Candidatus Mediterraneibacter intestinipullorum* sp. nov.**

6231 *Candidatus* Mediterraneibacter intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum*  
6232 gut; L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young  
6233 chickens)

6234

6235 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6236 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6237 assigned the MAG ID CHK161-4361 and which is available via NCBI BioSample  
6238 SAMN15816656. The GC content of the type genome is 49.75% and the genome length is 2.5  
6239 Mbp.

6240

6241

6242 **Description of *Candidatus Mediterraneibacter merdavium* sp. nov.**

6243 *Candidatus* Mediterraneibacter merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n.  
6244 *avis* bird; N.L. gen. n. *merdavium* of bird faeces)

6245

6246 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6247 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6248 assigned the MAG ID ChiBcolR7-8672 and which is available via NCBI BioSample  
6249 SAMN15816660. The GC content of the type genome is 49.88% and the genome length is 2.6  
6250 Mbp.

6251

6252

6253 **Description of *Candidatus Mediterraneibacter merdigallarum* sp. nov.**

6254 *Candidatus* Mediterraneibacter merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces;  
6255 L. fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

6256

6257 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6258 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6259 assigned the MAG ID ChiW16-1363 and which is available via NCBI BioSample  
6260 SAMN15816674. The GC content of the type genome is 46.95% and the genome length is 2.4  
6261 Mbp.

6262

6263

6264 **Description of *Candidatus Mediterraneibacter merdipullorum* sp. nov.**

6265 *Candidatus* Mediterraneibacter merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L.  
6266 masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

6267

6268 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6269 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6270 assigned the MAG ID ChiSxjej4B16-6421 and which is available via NCBI BioSample  
6271 SAMN15816679. The GC content of the type genome is 54.17% and the genome length is 2.2  
6272 Mbp.

6273  
6274

6275 **Description of *Candidatus Mediterraneibacter norfolkensis* sp. nov.**

6276 *Candidatus* Mediterraneibacter norfolkensis (nor.folk.en'sis. N.L. fem. adj. *norfolkensis*  
6277 pertaining to the English county of Norfolk)

6278

6279 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6280 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6281 assigned the MAG ID ChiW9-3490 and which is available via NCBI BioSample  
6282 SAMN15816789. The GC content of the type genome is 48.85% and the genome length is 3.5  
6283 Mbp.

6284  
6285

6286 **Description of *Candidatus Mediterraneibacter norwichensis* sp. nov.**

6287 *Candidatus* Mediterraneibacter norwichensis (nor.wich.en'sis. N.L. fem. adj. *norwichensis*  
6288 pertaining to English city of Norwich)

6289

6290 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6291 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6292 assigned the MAG ID CHK180-4461 and which is available via NCBI BioSample  
6293 SAMN15816628. The GC content of the type genome is 47.61% and the genome length is 2.6  
6294 Mbp.

6295  
6296

6297 **Description of *Candidatus Mediterraneibacter ornithocaccae* sp. nov.**

6298 *Candidatus* Mediterraneibacter ornithocaccae (or.ni.tho.cac'cae. Gr. masc. or fem. n. *ornis*,  
6299 *ornithos* bird Gr. fem. n. *kakke* faeces; N.L. gen. n. *ornithocaccae* of bird faeces)

6300

6301 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6302 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6303 assigned the MAG ID ChiGjej1B1-20579 and which is available via NCBI BioSample  
6304 SAMN15816839. This is a new name for the alphanumeric GTDB species sp002159505. The  
6305 GC content of the type genome is 47.31% and the genome length is 2.6 Mbp.

6306  
6307

6308 **Description of *Candidatus Mediterraneibacter pullicola* sp. nov.**

6309 *Candidatus* Mediterraneibacter pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff.  
6310 *-cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

6311

6312 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6313 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

6314 assigned the MAG ID ChiSjej2B20-11307 and which is available via NCBI BioSample  
6315 SAMN15816678. The GC content of the type genome is 47.35% and the genome length is 2.1  
6316 Mbp.

6317  
6318

6319 **Description of *Candidatus Mediterraneibacter pullistercoris* sp. nov.**

6320 *Candidatus* Mediterraneibacter pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young  
6321 chicken; L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

6322

6323 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6324 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6325 assigned the MAG ID ChiHjej8B7-7219 and which is available via NCBI BioSample  
6326 SAMN15816602. The GC content of the type genome is 48.73% and the genome length is 2.3  
6327 Mbp.

6328

6329

6330 **Description of *Candidatus Mediterraneibacter quadrami* sp. nov.**

6331 *Candidatus* Mediterraneibacter quadrami (quad.ra'mi. N.L. gen. n. *quadrami* of the Quadram  
6332 Institute)

6333

6334 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6335 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6336 assigned the MAG ID ChiBcec15-3976 and which is available via NCBI BioSample  
6337 SAMN15816790. The GC content of the type genome is 52.68% and the genome length is 2.0  
6338 Mbp.

6339

6340

6341 **Description of *Candidatus Mediterraneibacter stercoravium* sp. nov.**

6342 *Candidatus* Mediterraneibacter stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem.  
6343 n. *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

6344

6345 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6346 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6347 assigned the MAG ID CHK196-3914 and which is available via NCBI BioSample  
6348 SAMN15816603. The GC content of the type genome is 48.72% and the genome length is 2.5  
6349 Mbp.

6350

6351

6352 **Description of *Candidatus Mediterraneibacter stercorigallinarum* sp. nov.**

6353 *Candidatus* Mediterraneibacter stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
6354 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

6355

6356 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6357 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6358 assigned the MAG ID ChiGjej1B1-13045 and which is available via NCBI BioSample

6359 SAMN15816697. The GC content of the type genome is 50.04% and the genome length is 2.3  
6360 Mbp.

6361

6362

6363 **Description of *Candidatus Mediterraneibacter stercoripullorum* sp. nov.**

6364 *Candidatus* Mediterraneibacter stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung;  
6365 L. masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young  
6366 chickens)

6367

6368 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6369 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6370 assigned the MAG ID CHK195-1396 and which is available via NCBI BioSample  
6371 SAMN15816610. The GC content of the type genome is 48.12% and the genome length is 3.2  
6372 Mbp.

6373

6374

6375 **Description of *Candidatus Mediterraneibacter surreyensis* sp. nov.**

6376 *Candidatus* Mediterraneibacter surreyensis (sur.rey.en'sis. N.L. fem. adj. *surreyensis* pertaining  
6377 to the English county of Surrey where the samples in the study were collected)

6378

6379 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6380 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6381 assigned the MAG ID CHK177-12742 and which is available via NCBI BioSample  
6382 SAMN15816593. The GC content of the type genome is 46.80% and the genome length is 2.9  
6383 Mbp.

6384

6385

6386 **Description of *Candidatus Mediterraneibacter tabaqchaliae* sp. nov.**

6387 *Candidatus* Mediterraneibacter tabaqchaliae (ta.baq.cha'li.ae. N.L. fem. gen. n. *tabaqchaliae*  
6388 named in honour of British microbiologist Soad Tabaqchali)

6389

6390 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6391 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6392 assigned the MAG ID ChiGjej3B3-11674 and which is available via NCBI BioSample  
6393 SAMN15816791. The GC content of the type genome is 51.91% and the genome length is 2.7  
6394 Mbp.

6395

6396

6397 **Description of *Candidatus Mediterraneibacter vanvlietii* sp. nov.**

6398 *Candidatus* Mediterraneibacter vanvlietii (van.vliet'i.i. N.L. gen. n. *vanvlietii* named in honour of  
6399 Dutch microbiologist Arnoud van Vliet)

6400

6401 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6402 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6403 assigned the MAG ID ChiBcecl-362 and which is available via NCBI BioSample

6404 SAMN15816623. The GC content of the type genome is 48.47% and the genome length is 3.0  
6405 Mbp.

6406  
6407

6408 **Description of *Candidatus Megamonas gallistercoris* sp. nov.**

6409 *Candidatus Megamonas gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
6410 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

6411

6412 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6413 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6414 assigned the MAG ID ChiGjej6B6-7947 and which is available via NCBI BioSample  
6415 SAMN15816859. This is a new name for the alphanumeric GTDB species sp900554895. The  
6416 GC content of the type genome is 40.34% and the genome length is 2.2 Mbp.

6417

6418

6419 **Description of *Candidatus Merdenecus* gen. nov.**

6420 *Candidatus Merdenecus* (Merd.en.e'cus. L. fem. n. *merda* dung; Gr. masc. *enoikos* inhabitant;  
6421 N.L. masc. n. *Merdenecus* a microbe associated with faeces)

6422

6423 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6424 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6425 species *Merdenecus merdavium*. This is a name for the alphanumeric GTDB genus MCWD5.  
6426 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
6427 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
6428 *Lachnospiraceae*.

6429

6430

6431 **Description of *Candidatus Merdenecus merdavium* sp. nov.**

6432 *Candidatus Merdenecus merdavium* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
6433 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

6434

6435 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6436 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6437 assigned the MAG ID CHK160-2840 and which is available via NCBI BioSample  
6438 SAMN15817122. The GC content of the type genome is 35.46% and the genome length is 2.6  
6439 Mbp.

6440

6441

6442 **Description of *Candidatus Merdibacter merdavium* sp. nov.**

6443 *Candidatus Merdibacter merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
6444 N.L. gen. n. *merdavium* of bird faeces)

6445

6446 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6447 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6448 assigned the MAG ID CHK187-11901 and which is available via NCBI BioSample

6449 SAMN15816582. The GC content of the type genome is 53.13% and the genome length is 2.1  
6450 Mbp.

6451

6452

6453 **Description of *Candidatus Merdibacter merdigallinarum* sp. nov.**

6454 *Candidatus Merdibacter merdigallinarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
6455 n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

6456

6457 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6458 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6459 assigned the MAG ID ChiGjej6B6-453 and which is available via NCBI BioSample

6460 SAMN15816595. The GC content of the type genome is 53.92% and the genome length is 1.8  
6461 Mbp.

6462

6463

6464 **Description of *Candidatus Merdibacter merdipullorum* sp. nov.**

6465 *Candidatus Merdibacter merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
6466 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

6467

6468 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6469 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6470 assigned the MAG ID ChiGjej1B1-19782 and which is available via NCBI BioSample

6471 SAMN15816850. This is a new name for the alphanumeric GTDB species sp900543035. The  
6472 GC content of the type genome is 55.41% and the genome length is 1.9 Mbp.

6473

6474

6475 **Description of *Candidatus Merdicola* gen. nov.**

6476 *Candidatus Merdicola* (Mer.di.co'la. L. fem. n. *merda* dung; L. suff. *-cola* inhabitant of; N.L.  
6477 fem. n. *Merdicola* a microbe associated with faeces)

6478

6479 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6480 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6481 species *Merdicola faecigallinarum*. This is a name for the alphanumeric GTDB genus CAG-354.

6482 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
6483 (Chaumeil et al., 2019; Parks et al., 2020) to the order *TANB77* and to the family *CAG-508*.

6484

6485

6486 **Description of *Candidatus Merdicola faecigallinarum* sp. nov.**

6487 *Candidatus Merdicola faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
6488 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

6489

6490 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6491 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6492 assigned the MAG ID CHK195-15760 and which is available via NCBI BioSample

6493 SAMN15817051. The GC content of the type genome is 28.83% and the genome length is 1.5  
6494 Mbp.

6495

6496

**Description of *Candidatus Merdimorpha* gen. nov.**

6498 *Candidatus Merdimorpha* (Merd.i.mor'pha. L. fem. n. *merda* dung; Gr. fem. n. *morphe* a form,  
6499 shape; N.L. fem. n. *Merdimorpha* a microbe associated with faeces)

6500

6501 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6502 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6503 species *Merdimorpha intestinavium*. This is a name for the alphanumeric GTDB genus  
6504 UBA1820. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
6505 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Flavobacteriales* and to the family  
6506 *UBA1820*.

6507

6508

**Description of *Candidatus Merdimorpha intestinavium* sp. nov.**

6510 *Candidatus Merdimorpha intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
6511 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

6512

6513 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6514 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6515 assigned the MAG ID CHK1-7158 and which is available via NCBI BioSample  
6516 SAMN15817210. This is a new name for the alphanumeric GTDB species sp002314265. The  
6517 GC content of the type genome is 56.50% and the genome length is 1.8 Mbp.

6518

6519

**Description of *Candidatus Merdimorpha stercoravium* sp. nov.**

6521 *Candidatus Merdimorpha stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
6522 bird; N.L. gen. n. *stercoravium* of bird faeces)

6523

6524 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6525 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6526 assigned the MAG ID 1383 and which is available via NCBI BioSample SAMN15817125. The  
6527 GC content of the type genome is 57.82% and the genome length is 1.7 Mbp.

6528

6529

**Description of *Candidatus Merdiplasma* gen. nov.**

6531 *Candidatus Merdiplasma* (Merd.i.plas'ma. L. fem. n. *merda* dung; Gr. neut. n. *plasma* a form;  
6532 N.L. neut. n. *Merdiplasma* a microbe associated with faeces)

6533

6534 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6535 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6536 species *Merdiplasma excrementigallinarum*. This is a name for the alphanumeric GTDB genus  
6537 UBA2856. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
6538 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
6539 *Lachnospiraceae*.

6540

6541

**6542 Description of *Candidatus Merdiplasma excrementigallinarum* sp. nov.**

6543 *Candidatus Merdiplasma excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
6544 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
6545 excrement)

6546

6547 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6548 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6549 assigned the MAG ID ChiBcec6-7307 and which is available via NCBI BioSample  
6550 SAMN15817161. The GC content of the type genome is 52.97% and the genome length is 2.4  
6551 Mbp.

6552

6553

**6554 Description of *Candidatus Merdisoma* gen. nov.**

6555 *Candidatus Merdisoma* (Merd.i.so'ma. L. fem. n. *merda* dung; Gr. neut. n. *soma* a body; N.L.  
6556 neut. n. *Merdisoma* a microbe associated with faeces)

6557

6558 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6559 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6560 species *Merdisoma merdipullorum*. This is a name for the alphanumeric GTDB genus GCA-  
6561 900066575. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
6562 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
6563 *Lachnospiraceae*.

6564

6565

**6566 Description of *Candidatus Merdisoma faecalis* sp. nov.**

6567 *Candidatus Merdisoma faecalis* (fae.ca'lis. L. fem. adj. *faecalis* of faeces)

6568

6569 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6570 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6571 assigned the MAG ID ChiBcolR2-1241 and which is available via NCBI BioSample  
6572 SAMN15817219. This is a new name for the alphanumeric GTDB species sp002160765. The  
6573 GC content of the type genome is 51.56% and the genome length is 2.7 Mbp.

6574

6575

**6576 Description of *Candidatus Merdisoma merdipullorum* sp. nov.**

6577 *Candidatus Merdisoma merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
6578 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

6579

6580 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6581 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6582 assigned the MAG ID CHK197-19677 and which is available via NCBI BioSample  
6583 SAMN15817042. The GC content of the type genome is 50.06% and the genome length is 2.9  
6584 Mbp.

6585

6586

6587 **Description of *Candidatus Merdivicinus* gen. nov.**

6588 *Candidatus Merdivicinus* (Merd.ivic.in'us. L. fem. n. *merda* dung; L. masc. n. *vicinus* a  
6589 neighbour; N.L. masc. n. *Merdivicinus* a microbe associated with faeces)

6590

6591 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6592 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6593 species *Merdivicinus faecavium*. This is a name for the alphanumeric GTDB genus UMG51826.  
6594 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
6595 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
6596 *Ruminococcaceae*.

6597

6598

6599 **Description of *Candidatus Merdivicinus excrementipullorum* sp. nov.**

6600 *Candidatus Merdivicinus excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
6601 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
6602 chicken excrement)

6603

6604 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6605 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6606 assigned the MAG ID CHK199-13235 and which is available via NCBI BioSample  
6607 SAMN15817032. The GC content of the type genome is 54.67% and the genome length is 2.5  
6608 Mbp.

6609

6610

6611 **Description of *Candidatus Merdivicinus faecavium* sp. nov.**

6612 *Candidatus Merdivicinus faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
6613 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

6614

6615 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6616 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6617 assigned the MAG ID CHK186-19003 and which is available via NCBI BioSample  
6618 SAMN15817036. The GC content of the type genome is 61.26% and the genome length is 2.5  
6619 Mbp.

6620

6621

6622 **Description of *Candidatus Merdivicinus intestinavium* sp. nov.**

6623 *Candidatus Merdivicinus intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
6624 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

6625

6626 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6627 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6628 assigned the MAG ID CHK188-1901 and which is available via NCBI BioSample  
6629 SAMN15817003. The GC content of the type genome is 59.41% and the genome length is 2.3  
6630 Mbp.

6631

6632

6633 **Description of *Candidatus Merdivicinus intestinigallarum* sp. nov.**

6634 *Candidatus Merdivicinus intestinigallarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
6635 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

6636  
6637 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6638 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6639 assigned the MAG ID ChiBcec18-2170 and which is available via NCBI BioSample  
6640 SAMN15817163. The GC content of the type genome is 56.27% and the genome length is 2.5  
6641 Mbp.

6642

6643

6644 **Description of *Candidatus Merdivivens* gen. nov.**

6645 *Candidatus Merdivivens* (Merd.i.viv'ens. L. fem. n. *merda* dung; N.L. pres. part. *vivens* living;  
6646 N.L. fem. n. *Merdivivens* a microbe associated with faeces)

6647

6648 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6649 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6650 species *Merdivivens pullistercoris*. This is a name for the alphanumeric GTDB genus UBA3382.  
6651 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
6652 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family *UBA932*.

6653

6654

6655 **Description of *Candidatus Merdivivens faecigallarum* sp. nov.**

6656 *Candidatus Merdivivens faecigallarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
6657 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

6658

6659 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6660 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6661 assigned the MAG ID B3-2255 and which is available via NCBI BioSample SAMN15817168.  
6662 This is a new name for the alphanumeric GTDB species sp002159555. The GC content of the  
6663 type genome is 49.87% and the genome length is 1.9 Mbp.

6664

6665

6666 **Description of *Candidatus Merdivivens pullicola* sp. nov.**

6667 *Candidatus Merdivivens pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
6668 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

6669

6670 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6671 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6672 assigned the MAG ID B1-8020 and which is available via NCBI BioSample SAMN15817062.  
6673 The GC content of the type genome is 48.22% and the genome length is 2.0 Mbp.

6674

6675

6676 **Description of *Candidatus Merdivivens pullistercoris* sp. nov.**

6677 *Candidatus Merdivivens pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
6678 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

6679

6680 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6681 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6682 assigned the MAG ID 10037 and which is available via NCBI BioSample SAMN15817074. The  
6683 GC content of the type genome is 48.95% and the genome length is 2.1 Mbp.

6684

6685

6686 **Description of *Candidatus Merdousia* gen. nov.**

6687 *Candidatus Merdousia* (Merd.ou'si.a. L. fem. n. *merda* dung; Gr. fem. n. *ousia* an essence; N.L.  
6688 fem. n. *Merdousia* a microbe associated with faeces)

6689

6690 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6691 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6692 species *Merdousia gallistercoris*. This is a name for the alphanumeric GTDB genus CAG-312.  
6693 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
6694 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Opitutales* and to the family *CAG-312*.

6695

6696

6697 **Description of *Candidatus Merdousia gallistercoris* sp. nov.**

6698 *Candidatus Merdousia gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
6699 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

6700

6701 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6702 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6703 assigned the MAG ID CHK197-16368 and which is available via NCBI BioSample  
6704 SAMN15817207. This is a new name for the alphanumeric GTDB species sp900545715. The  
6705 GC content of the type genome is 49.37% and the genome length is 2.4 Mbp.

6706

6707

6708 **Description of *Candidatus Methanocorpusculum faecipullorum* sp. nov.**

6709 *Candidatus Methanocorpusculum faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis*  
6710 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
6711 faeces)

6712

6713 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6714 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6715 assigned the MAG ID E1-3281 and which is available via NCBI BioSample SAMN15816796.  
6716 The GC content of the type genome is 50.72% and the genome length is 1.2 Mbp.

6717

6718

6719 **Description of *Candidatus Microbacterium pullistercoris* sp. nov.**

6720 *Candidatus Microbacterium pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken;  
6721 L. neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

6722

6723 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6724 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

6725 assigned the MAG ID ChiGjej1B1-5908 and which is available via NCBI BioSample  
6726 SAMN15816649. The GC content of the type genome is 68.74% and the genome length is 2.5  
6727 Mbp.

6728  
6729

6730 **Description of *Candidatus Microbacterium stercoravium* sp. nov.**

6731 *Candidatus* Microbacterium stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
6732 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

6733

6734 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6735 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6736 assigned the MAG ID ChiHjej8B7-3636 and which is available via NCBI BioSample  
6737 SAMN15816680. The GC content of the type genome is 69.44% and the genome length is 2.5  
6738 Mbp.

6739

6740

6741 **Description of *Candidatus Monoglobus merdigallarum* sp. nov.**

6742 *Candidatus* Monoglobus merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
6743 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

6744

6745 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6746 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6747 assigned the MAG ID 5790 and which is available via NCBI BioSample SAMN15816780. The  
6748 GC content of the type genome is 48.24% and the genome length is 1.5 Mbp.

6749

6750

6751 **Description of *Candidatus Mucispirillum faecigallarum* sp. nov.**

6752 *Candidatus* Mucispirillum faecigallarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
6753 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

6754

6755 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6756 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6757 assigned the MAG ID ChiW4-1371 and which is available via NCBI BioSample  
6758 SAMN15816684. The GC content of the type genome is 31.75% and the genome length is 2.2  
6759 Mbp.

6760

6761

6762 **Description of *Candidatus Negativibacillus faecipullorum* sp. nov.**

6763 *Candidatus* Negativibacillus faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement;  
6764 L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

6765

6766 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6767 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6768 assigned the MAG ID ChiBcec6-1156 and which is available via NCBI BioSample  
6769 SAMN15816879. This is a new name for the alphanumeric GTDB species sp900547455. The  
6770 GC content of the type genome is 57.54% and the genome length is 2.0 Mbp.

6771

6772

**Description of *Candidatus Nesterenkonia stercoripullorum* sp. nov.**

6774 *Candidatus* Nesterenkonia stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
6775 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

6776

6777 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6778 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6779 assigned the MAG ID ChiHejej3B27-3195 and which is available via NCBI BioSample  
6780 SAMN15816751. The GC content of the type genome is 65.88% and the genome length is 2.6  
6781 Mbp.

6782

6783

**Description of *Candidatus Niameybacter stercoravium* sp. nov.**

6784 *Candidatus* Niameybacter stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
6785 bird; N.L. gen. n. *stercoravium* of bird faeces)

6786

6787 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6788 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6789 assigned the MAG ID 2467 and which is available via NCBI BioSample SAMN15816773. The  
6790 GC content of the type genome is 35.14% and the genome length is 2.9 Mbp.

6791

6792

**Description of *Candidatus Nocardiosis merdipullorum* sp. nov.**

6793 *Candidatus* Nocardiosis merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
6794 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

6795

6796 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6797 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6798 assigned the MAG ID ChiHjej10B9-18110 and which is available via NCBI BioSample  
6799 SAMN15816716. The GC content of the type genome is 65.81% and the genome length is 4.2  
6800 Mbp.

6801

6802

**Description of *Candidatus Nosocomiicoccus stercorigallinarum* sp. nov.**

6803 *Candidatus* Nosocomiicoccus stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
6804 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

6805

6806 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6807 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6808 assigned the MAG ID CHK169-14505 and which is available via NCBI BioSample  
6809 SAMN15816647. The GC content of the type genome is 34.64% and the genome length is 1.3  
6810 Mbp.

6811

6812

**Description of *Candidatus Oceanisphaera merdipullorum* sp. nov.**

6813

6814

6815

6816

6817 *Candidatus* Oceanisphaera merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc.  
6818 n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

6819

6820 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6821 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6822 assigned the MAG ID 819 and which is available via NCBI BioSample SAMN15816797. The  
6823 GC content of the type genome is 50.19% and the genome length is 2.9 Mbp.

6824

6825

6826 **Description of *Candidatus* Odoribacter faecigallinarum sp. nov.**

6827 *Candidatus* Odoribacter faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
6828 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

6829

6830 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6831 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6832 assigned the MAG ID 23274 and which is available via NCBI BioSample SAMN15816743. The  
6833 GC content of the type genome is 48.17% and the genome length is 2.2 Mbp.

6834

6835

6836 **Description of *Candidatus* Olsenella avicola sp. nov.**

6837 *Candidatus* Olsenella avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
6838 *avicola* inhabitant of birds)

6839

6840 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6841 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6842 assigned the MAG ID CHK1-7693 and which is available via NCBI BioSample  
6843 SAMN15816923. This is a new name for the alphanumeric GTDB species sp002159625.

6844 Although GTDB has assigned this species to the genus it calls Olsenella\_E , this genus  
6845 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
6846 have used the current validly published name for the genus. The GC content of the type genome  
6847 is 67.59% and the genome length is 2.2 Mbp.

6848

6849

6850 **Description of *Candidatus* Olsenella avistercoris sp. nov.**

6851 *Candidatus* Olsenella avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
6852 N.L. gen. n. *avistercoris* of bird faeces)

6853

6854 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6855 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6856 assigned the MAG ID CHK136-6238 and which is available via NCBI BioSample  
6857 SAMN15816919. This is a new name for the alphanumeric GTDB species sp002160255.

6858 Although GTDB has assigned this species to the genus it calls Olsenella\_E , this genus  
6859 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
6860 have used the current validly published name for the genus. The GC content of the type genome  
6861 is 69.05% and the genome length is 2.0 Mbp.

6862

6863

**Description of *Candidatus Olsenella excrementavium* sp. nov.**

6864 *Candidatus* Olsenella excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum* excrement;  
6865 L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

6866

6867  
6868 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6869 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6870 assigned the MAG ID ChiHjej10B9-743 and which is available via NCBI BioSample  
6871 SAMN15816922. This is a new name for the alphanumeric GTDB species sp002305805.

6872 Although GTDB has assigned this species to the genus it calls Olsenella\_E , this genus  
6873 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
6874 have used the current validly published name for the genus. The GC content of the type genome  
6875 is 66.50% and the genome length is 1.8 Mbp.

6876

6877

**Description of *Candidatus Olsenella excrementigallinarum* sp. nov.**

6879 *Candidatus* Olsenella excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n. *excrementum*  
6880 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen excrement)

6881

6882 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6883 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6884 assigned the MAG ID ChiHjej12B11-23512 and which is available via NCBI BioSample  
6885 SAMN15816920. This is a new name for the alphanumeric GTDB species sp900119915.

6886 Although GTDB has assigned this species to the genus it calls Olsenella\_E , this genus  
6887 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
6888 have used the current validly published name for the genus. The GC content of the type genome  
6889 is 68.67% and the genome length is 1.8 Mbp.

6890

6891

**Description of *Candidatus Olsenella pullicola* sp. nov.**

6893 *Candidatus* Olsenella pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
6894 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

6895

6896 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6897 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6898 assigned the MAG ID ChiHecec1B25-7792 and which is available via NCBI BioSample  
6899 SAMN15816895. Although GTDB has assigned this species to the genus it calls Olsenella\_E ,  
6900 this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
6901 species, we have used the current validly published name for the genus. The GC content of the  
6902 type genome is 65.74% and the genome length is 2.3 Mbp.

6903

6904

**Description of *Candidatus Olsenella pullistercoris* sp. nov.**

6906 *Candidatus* Olsenella pullistercoris (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L. neut.  
6907 n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

6908

6909 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6910 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6911 assigned the MAG ID ChiHjej12B11-14209 and which is available via NCBI BioSample  
6912 SAMN15816899. Although GTDB has assigned this species to the genus it calls *Olsenella* E ,  
6913 this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
6914 species, we have used the current validly published name for the genus. The GC content of the  
6915 type genome is 67.21% and the genome length is 1.9 Mbp.

6916  
6917

6918 **Description of *Candidatus Olsenella stercoravium* sp. nov.**

6919 *Candidatus* *Olsenella stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
6920 bird; N.L. gen. n. *stercoravium* of bird faeces)

6921

6922 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6923 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6924 assigned the MAG ID ChiHecolR3B27-1887 and which is available via NCBI BioSample  
6925 SAMN15816902. Although GTDB has assigned this species to the genus it calls *Olsenella* E ,  
6926 this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
6927 species, we have used the current validly published name for the genus. The GC content of the  
6928 type genome is 67.26% and the genome length is 1.8 Mbp.

6929  
6930

6931 **Description of *Candidatus Onthenecus* gen. nov.**

6932 *Candidatus* *Onthenecus* (Onthen.e'cus. Gr. masc. n. *onthos* dung; Gr. masc. *enoikos* inhabitant;  
6933 N.L. masc. n. *Onthenecus* a microbe associated with faeces)

6934

6935 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6936 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6937 species *Onthenecus intestinigallinarum*. This is a name for the alphanumeric GTDB genus  
6938 OEMS01. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
6939 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
6940 *CAG-74*.

6941

6942

6943 **Description of *Candidatus Onthenecus intestinigallinarum* sp. nov.**

6944 *Candidatus* *Onthenecus intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
6945 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

6946

6947 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6948 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6949 assigned the MAG ID ChiSxjej2B14-6234 and which is available via NCBI BioSample  
6950 SAMN15817054. The GC content of the type genome is 66.20% and the genome length is 2.4  
6951 Mbp.

6952

6953

6954 **Description of *Candidatus Onthocola* gen. nov.**

6955 *Candidatus* Onthocola (On.tho.co'la. Gr. masc. n. *onthos* dung; L. suff. *-cola* inhabitant of; N.L.  
6956 fem. n. *Onthocola* a microbe associated with faeces)

6957

6958 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
6959 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
6960 species *Onthocola gallistercoris*. This is a name for the alphanumeric GTDB genus. This genus  
6961 has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al.,  
6962 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family *Lachnospiraceae*.

6963

6964

6965 **Description of *Candidatus Onthocola gallistercoris* sp. nov.**

6966 *Candidatus* Onthocola gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n.  
6967 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

6968

6969 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6970 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6971 assigned the MAG ID CHK187-14744 and which is available via NCBI BioSample  
6972 SAMN15817044. The GC content of the type genome is 48.32% and the genome length is 2.4  
6973 Mbp.

6974

6975

6976 **Description of *Candidatus Onthocola stercoravium* sp. nov.**

6977 *Candidatus* Onthocola stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
6978 bird; N.L. gen. n. *stercoravium* of bird faeces)

6979

6980 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6981 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6982 assigned the MAG ID ChiW5-5982 and which is available via NCBI BioSample  
6983 SAMN15817021. The GC content of the type genome is 28.08% and the genome length is 1.4  
6984 Mbp.

6985

6986

6987 **Description of *Candidatus Onthocola stercorigallinarum* sp. nov.**

6988 *Candidatus* Onthocola stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
6989 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

6990

6991 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
6992 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
6993 assigned the MAG ID CHK195-3072 and which is available via NCBI BioSample  
6994 SAMN15817046. The GC content of the type genome is 27.21% and the genome length is 1.3  
6995 Mbp.

6996

6997

6998 **Description of *Candidatus Onthomonas* gen. nov.**

6999 *Candidatus* Onthomonas (On.tho.mo'nas. Gr. masc. n. *onthos* dung; L. fem. n. *monas* a monad;  
7000 N.L. fem. n. *Onthomonas* a microbe associated with faeces)

7001

7002 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7003 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7004 species *Onthomonas avicola*. This is a name for the alphanumeric GTDB genus NK3B98. This  
7005 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
7006 al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family *Oscillospiraceae*.

7007

7008

7009 **Description of *Candidatus Onthomonas avicola* sp. nov.**

7010 *Candidatus Onthomonas avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
7011 n. *avicola* inhabitant of birds)

7012

7013 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7014 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7015 assigned the MAG ID ChiGjej6B6-14002 and which is available via NCBI BioSample  
7016 SAMN15817096. The GC content of the type genome is 63.01% and the genome length is 2.4  
7017 Mbp.

7018

7019

7020 **Description of *Candidatus Onthomorpha* gen. nov.**

7021 *Candidatus Onthomorpha* (On.tho.mor'pha. Gr. masc. n. *onthos* dung; Gr. fem. n. *morphe* a  
7022 form, shape; N.L. fem. n. *Onthomorpha* a microbe associated with faeces)

7023

7024 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7025 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7026 species *Onthomorpha intestinigallinarum*. This is a name for the alphanumeric GTDB genus  
7027 UBA3388. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7028 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Bacteroidales* and to the family *P3*.

7029

7030

7031 **Description of *Candidatus Onthomorpha intestinigallinarum* sp. nov.**

7032 *Candidatus Onthomorpha intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
7033 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

7034

7035 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7036 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7037 assigned the MAG ID Gambia16-930 and which is available via NCBI BioSample  
7038 SAMN15817128. The GC content of the type genome is 42.76% and the genome length is 1.7  
7039 Mbp.

7040

7041

7042 **Description of *Candidatus Onthoplasma* gen. nov.**

7043 *Candidatus Onthoplasma* (On.tho.plas'ma. Gr. masc. n. *onthos* dung; Gr. neut. n. *plasma* a form;  
7044 N.L. neut. n. *Onthoplasma* a microbe associated with faeces)

7045

7046 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7047 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7048 species *Onthoplasma faecipullorum*. This is a name for the alphanumeric GTDB genus  
7049 UBA4626. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7050 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *4C28d-15* and to the family  
7051 *UBA1242*.

7052  
7053

7054 **Description of *Candidatus Onthoplasma faecigallinarum* sp. nov.**

7055 *Candidatus* *Onthoplasma faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
7056 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

7057

7058 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7059 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7060 assigned the MAG ID 5992 and which is available via NCBI BioSample SAMN15817127. The  
7061 GC content of the type genome is 34.71% and the genome length is 1.0 Mbp.

7062

7063

7064 **Description of *Candidatus Onthoplasma faecipullorum* sp. nov.**

7065 *Candidatus* *Onthoplasma faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
7066 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

7067

7068 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7069 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7070 assigned the MAG ID CHK191-42317 and which is available via NCBI BioSample  
7071 SAMN15817053. The GC content of the type genome is 31.88% and the genome length is 1.1  
7072 Mbp.

7073

7074

7075 **Description of *Candidatus Onthosoma* gen. nov.**

7076 *Candidatus* *Onthosoma* (On.tho.so'ma. Gr. masc. n. *onthos* dung; Gr. neut. n. *soma* a body; N.L.  
7077 neut. n. *Onthosoma* a microbe associated with faeces)

7078

7079 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7080 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7081 species *Onthosoma merdavium*. This is a name for the alphanumeric GTDB genus OEMR01.  
7082 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
7083 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Erysipelotrichales* and to the family  
7084 *Erysipelotrichaceae*.

7085

7086

7087 **Description of *Candidatus Onthosoma merdavium* sp. nov.**

7088 *Candidatus* *Onthosoma merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
7089 N.L. gen. n. *merdavium* of bird faeces)

7090

7091 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7092 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7093 assigned the MAG ID ChiBcec15-4520 and which is available via NCBI BioSample  
7094 SAMN15817169. This is a new name for the alphanumeric GTDB species sp900199515. The  
7095 GC content of the type genome is 45.30% and the genome length is 1.6 Mbp.

7096  
7097

7098 **Description of *Candidatus Onthousia* gen. nov.**

7099 *Candidatus* Onthousia (Onth.ou'si.a. Gr. masc. n. *onthos* dung; Gr. fem. n. *ousia* an essence;  
7100 N.L. fem. n. *Onthousia* a microbe associated with faeces)

7101

7102 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7103 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7104 species *Onthousia faecavium*. This is a name for the alphanumeric GTDB genus CAG-451. This  
7105 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
7106 al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-611*.

7107

7108

7109 **Description of *Candidatus Onthousia excrementipullorum* sp. nov.**

7110 *Candidatus* Onthousia excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
7111 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
7112 chicken excrement)

7113

7114 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7115 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7116 assigned the MAG ID CHK184-20233 and which is available via NCBI BioSample  
7117 SAMN15817019. The GC content of the type genome is 27.72% and the genome length is 1.3  
7118 Mbp.

7119

7120

7121 **Description of *Candidatus Onthousia faecavium* sp. nov.**

7122 *Candidatus* Onthousia faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n. *avis*  
7123 bird; N.L. gen. n. *faecavium* of bird faeces)

7124

7125 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7126 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7127 assigned the MAG ID CHK195-6217 and which is available via NCBI BioSample  
7128 SAMN15817026. The GC content of the type genome is 28.40% and the genome length is 1.3  
7129 Mbp.

7130

7131

7132 **Description of *Candidatus Onthousia faecigallarum* sp. nov.**

7133 *Candidatus* Onthousia faecigallarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
7134 fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

7135

7136 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7137 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7138 assigned the MAG ID CHK135-1819 and which is available via NCBI BioSample  
7139 SAMN15817105. The GC content of the type genome is 32.62% and the genome length is 1.1  
7140 Mbp.

7141

7142

7143 **Description of *Candidatus Onthousia faecipullorum* sp. nov.**

7144 *Candidatus* Onthousia faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
7145 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

7146

7147 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7148 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7149 assigned the MAG ID CHK195-26880 and which is available via NCBI BioSample  
7150 SAMN15817040. The GC content of the type genome is 27.41% and the genome length is 1.4  
7151 Mbp.

7152

7153

7154 **Description of *Candidatus Onthovicinus* gen. nov.**

7155 *Candidatus* Onthovicinus (On.tho.vic.in'us. Gr. masc. n. *onthos* dung; L. masc. n. *vicinus* a  
7156 neighbour; N.L. masc. n. *Onthovicinus* a microbe associated with faeces)

7157

7158 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7159 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7160 species *Onthovicinus excrementipullorum*. This is a name for the alphanumeric GTDB genus  
7161 UMGS1839. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7162 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
7163 *Acutalibacteraceae*.

7164

7165

7166 **Description of *Candidatus Onthovicinus excrementipullorum* sp. nov.**

7167 *Candidatus* Onthovicinus excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
7168 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
7169 chicken excrement)

7170

7171 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7172 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7173 assigned the MAG ID CHK185-12131 and which is available via NCBI BioSample  
7174 SAMN15817020. The GC content of the type genome is 55.55% and the genome length is 2.4  
7175 Mbp.

7176

7177

7178 **Description of *Candidatus Onthovivens* gen. nov.**

7179 *Candidatus* Onthovivens (On.tho.viv'ens. Gr. masc. n. *onthos* dung; N.L. pres. part. *vivens*  
7180 living; N.L. fem. n. *Onthovivens* a microbe associated with faeces)

7181

7182 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7183 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7184 species *Onthovivens merdipullorum*. This is a name for the alphanumeric GTDB genus  
7185 UBA4855. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7186 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFN20* and to the family *CAG-826*.

7187  
7188

7189 **Description of *Candidatus Onthovivens merdipullorum* sp. nov.**

7190 *Candidatus* Onthovivens merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
7191 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

7192

7193 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7194 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7195 assigned the MAG ID 11159 and which is available via NCBI BioSample SAMN15817139. The  
7196 GC content of the type genome is 27.05% and the genome length is 1.5 Mbp.

7197

7198

7199 **Description of *Candidatus Ornithocaccomicrobium* gen. nov.**

7200 *Candidatus* Ornithocaccomicrobium (Or.ni.tho.cac.co.mi.cro'bi.um. Gr. masc. or fem. n. *ornis*,  
7201 *ornithos* bird; Gr. fem. n. *kakke* faeces; N.L. neut. n. *microbium* a microbe; N.L. neut. n.  
7202 *Ornithocaccomicrobium* A microbe found in chicken faeces)

7203

7204 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7205 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7206 species *Ornithocaccomicrobium faecavium*. This genus was identified but not named by  
7207 Glendinning et al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release  
7208 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the  
7209 family *CAG-74*.

7210

7211

7212 **Description of *Candidatus Ornithocaccomicrobium faecavium* sp. nov.**

7213 *Candidatus* Ornithocaccomicrobium faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement;  
7214 L. fem. n. *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

7215

7216 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7217 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7218 assigned the MAG ID CHK183-6373 and which is available via NCBI BioSample  
7219 SAMN15816945. The GC content of the type genome is 59.48% and the genome length is 2.9  
7220 Mbp.

7221

7222

7223 **Description of *Candidatus Ornithoclostridium* gen. nov.**

7224 *Candidatus* Ornithoclostridium (Or.ni.tho.clos.tri'di.um. Gr. masc. or fem. n. *ornis*, *ornithos* bird;  
7225 N.L. neut. n. *Clostridium* a genus name; N.L. neut. n. *Ornithoclostridium* a genus related to the  
7226 genus *Clostridium* but distinct from it and found in poultry)

7227

7228 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7229 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7230 species *Ornithoclostridium excrementipullorum*. This genus has been assigned by GTDB-Tk  
7231 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
7232 order *Christensenellales* and to the family *UBA3700*.  
7233  
7234

7235 **Description of *Candidatus Ornithoclostridium excrementipullorum* sp. nov.**

7236 *Candidatus* Ornithoclostridium excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
7237 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
7238 young chicken excrement)  
7239

7240 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7241 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7242 assigned the MAG ID ChiW5-1639 and which is available via NCBI BioSample  
7243 SAMN15816971. The GC content of the type genome is 54.62% and the genome length is 1.6  
7244 Mbp.  
7245  
7246

7247 **Description of *Candidatus Ornithoclostridium faecavium* sp. nov.**

7248 *Candidatus* Ornithoclostridium faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L.  
7249 fem. n. *avis* bird; N.L. gen. n. *faecavium* of bird faeces)  
7250

7251 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7252 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7253 assigned the MAG ID 63 and which is available via NCBI BioSample SAMN15816992. The GC  
7254 content of the type genome is 48.09% and the genome length is 1.8 Mbp.  
7255  
7256

7257 **Description of *Candidatus Ornithoclostridium faecigallinarum* sp. nov.**

7258 *Candidatus* Ornithoclostridium faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
7259 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)  
7260

7261 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7262 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7263 assigned the MAG ID ChiHcolR4-3946 and which is available via NCBI BioSample  
7264 SAMN15816996. The GC content of the type genome is 57.12% and the genome length is 1.6  
7265 Mbp.  
7266  
7267

7268 **Description of *Candidatus Ornithomonoglobus* gen. nov.**

7269 *Candidatus* Ornithomonoglobus (Or.ni.tho.mo.no.glo'bus. Gr. masc. or fem. n. *ornis*, *ornithos*  
7270 bird; N.L. masc. n. *Monoglobus* a genus name; N.L. masc. n. *Ornithomonoglobus* a genus related  
7271 to the genus *Monoglobus* but distinct from it and found in poultry)  
7272

7273 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7274 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7275 species *Ornithomonoglobus merdipullorum*. This genus was identified but not named by  
7276 Glendinning et al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release  
7277 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Monoglobales* and to the family  
7278 *UBA1381*.

7279  
7280

7281 **Description of *Candidatus Ornithomonoglobus intestinigallarum* sp. nov.**

7282 *Candidatus* Ornithomonoglobus intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n.  
7283 *intestinum* gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

7284

7285 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7286 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7287 assigned the MAG ID CHK181-108 and which is available via NCBI BioSample  
7288 SAMN15816941. The GC content of the type genome is 49.36% and the genome length is 2.2  
7289 Mbp.

7290

7291

7292 **Description of *Candidatus Ornithomonoglobus merdipullorum* sp. nov.**

7293 *Candidatus* Ornithomonoglobus merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L.  
7294 masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

7295

7296 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7297 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7298 assigned the MAG ID USAMLcec3-3695 and which is available via NCBI BioSample  
7299 SAMN15816942. The GC content of the type genome is 48.52% and the genome length is 2.7  
7300 Mbp.

7301

7302

7303 **Description of *Candidatus Ornithospirochaeta* gen. nov.**

7304 *Candidatus* Ornithospirochaeta (Or.ni.tho.spi.ro.chae'ta. Gr. masc. or fem. n. *ornis*, *ornithos* bird;  
7305 N.L. fem. n. *Spirochaeta* a genus name; N.L. fem. n. *Ornithospirochaeta* a genus related to the  
7306 genus *Spirochaeta* but distinct from it and found in poultry)

7307

7308 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7309 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7310 species *Ornithospirochaeta stercoravium*. This genus has been assigned by GTDB-Tk v1.3.0  
7311 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
7312 *Sphaerochaetales* and to the family *Sphaerochaetaceae*.

7313

7314

7315 **Description of *Candidatus Ornithospirochaeta avicola* sp. nov.**

7316 *Candidatus* Ornithospirochaeta avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant  
7317 of; N.L. n. *avicola* inhabitant of birds)

7318

7319 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7320 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7321 assigned the MAG ID Gambia11-129 and which is available via NCBI BioSample  
7322 SAMN15816993. The GC content of the type genome is 42.81% and the genome length is 1.5  
7323 Mbp.

7324  
7325

7326 **Description of *Candidatus Ornithospirochaeta stercoravium* sp. nov.**

7327 *Candidatus* Ornithospirochaeta stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem.  
7328 n. *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

7329

7330 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7331 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7332 assigned the MAG ID 14700 and which is available via NCBI BioSample SAMN15816953. The  
7333 GC content of the type genome is 46.26% and the genome length is 2.0 Mbp.

7334  
7335

7336 **Description of *Candidatus Ornithospirochaeta stercorigallarum* sp. nov.**

7337 *Candidatus* Ornithospirochaeta stercorigallarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
7338 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallarum* of hen faeces)

7339

7340 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7341 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7342 assigned the MAG ID ChiHecec3B27-9561 and which is available via NCBI BioSample  
7343 SAMN15816957. The GC content of the type genome is 46.77% and the genome length is 1.9  
7344 Mbp.

7345  
7346

7347 **Description of *Candidatus Ornithospirochaeta stercoripullorum* sp. nov.**

7348 *Candidatus* Ornithospirochaeta stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung;  
7349 L. masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young  
7350 chickens)

7351

7352 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7353 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7354 assigned the MAG ID 7293 and which is available via NCBI BioSample SAMN15816978. The  
7355 GC content of the type genome is 45.57% and the genome length is 2.0 Mbp.

7356  
7357

7358 **Description of *Candidatus Oscillibacter avistercoris* sp. nov.**

7359 *Candidatus* Oscillibacter avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
7360 dung; N.L. gen. n. *avistercoris* of bird faeces)

7361

7362 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7363 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7364 assigned the MAG ID CHK176-14096 and which is available via NCBI BioSample

7365 SAMN15816820. This is a new name for the alphanumeric GTDB species sp900556925. The  
7366 GC content of the type genome is 63.55% and the genome length is 2.3 Mbp.

7367

7368

7369 **Description of *Candidatus Oscillibacter excrementavium* sp. nov.**

7370 *Candidatus* Oscillibacter excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
7371 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

7372

7373 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7374 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7375 assigned the MAG ID 5302 and which is available via NCBI BioSample SAMN15816661. The  
7376 GC content of the type genome is 63.73% and the genome length is 2.5 Mbp.

7377

7378

7379 **Description of *Candidatus Oscillibacter excrementigallinarum* sp. nov.**

7380 *Candidatus* Oscillibacter excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
7381 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
7382 excrement)

7383

7384 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7385 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7386 assigned the MAG ID ChiBcec18-1249 and which is available via NCBI BioSample  
7387 SAMN15816667. The GC content of the type genome is 64.01% and the genome length is 2.4  
7388 Mbp.

7389

7390

7391 **Description of *Candidatus Oscillibacter pullicola* sp. nov.**

7392 *Candidatus* Oscillibacter pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
7393 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

7394

7395 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7396 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7397 assigned the MAG ID ChiBcolR2-4535 and which is available via NCBI BioSample  
7398 SAMN15816652. The GC content of the type genome is 63.62% and the genome length is 2.4  
7399 Mbp.

7400

7401

7402 **Description of *Candidatus Paenalcaligenes intestinipullorum* sp. nov.**

7403 *Candidatus* Paenalcaligenes intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut;  
7404 L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

7405

7406 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7407 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7408 assigned the MAG ID 9264 and which is available via NCBI BioSample SAMN15816786. The  
7409 GC content of the type genome is 51.92% and the genome length is 1.8 Mbp.

7410

7411

**7412 Description of *Candidatus Paenibacillus intestinavium* sp. nov.**

7413 *Candidatus* Paenibacillus intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
7414 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

7415

7416 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7417 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7418 assigned the MAG ID CHK172-12487 and which is available via NCBI BioSample  
7419 SAMN15816909. Although GTDB has assigned this species to the genus it calls Paenibacillus\_C  
7420 , this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
7421 species, we have used the current validly published name for the genus. The GC content of the  
7422 type genome is 39.31% and the genome length is 4.6 Mbp.

7423

7424

**7425 Description of *Candidatus Parabacteroides faecavium* sp. nov.**

7426 *Candidatus* Parabacteroides faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem.  
7427 n. *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

7428

7429 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7430 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7431 assigned the MAG ID CHK152-2511 and which is available via NCBI BioSample  
7432 SAMN15816864. This is a new name for the alphanumeric GTDB species sp000436495. The  
7433 GC content of the type genome is 42.40% and the genome length is 3.4 Mbp.

7434

7435

**7436 Description of *Candidatus Parabacteroides intestinavium* sp. nov.**

7437 *Candidatus* Parabacteroides intestinavium (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem.  
7438 n. *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

7439

7440 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7441 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7442 assigned the MAG ID ChiHjej11B10-3189 and which is available via NCBI BioSample  
7443 SAMN15816658. The GC content of the type genome is 44.93% and the genome length is 2.8  
7444 Mbp.

7445

7446

**7447 Description of *Candidatus Parabacteroides intestinigallarum* sp. nov.**

7448 *Candidatus* Parabacteroides intestinigallarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
7449 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

7450

7451 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7452 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7453 assigned the MAG ID ChiHecec2B26-12326 and which is available via NCBI BioSample  
7454 SAMN15816728. The GC content of the type genome is 52.90% and the genome length is 2.9  
7455 Mbp.

7456

7457

**Description of *Candidatus Parabacteroides intestinipullorum* sp. nov.**

7458 *Candidatus* Parabacteroides intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut;  
7459 L. masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

7461

7462 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7463 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7464 assigned the MAG ID ChiGjej6B6-14162 and which is available via NCBI BioSample  
7465 SAMN15816857. This is a new name for the alphanumeric GTDB species sp900552415. The  
7466 GC content of the type genome is 50.53% and the genome length is 3.2 Mbp.

7467

7468

**Description of *Candidatus Paralactobacillus gallistercoris* sp. nov.**

7469 *Candidatus* Paralactobacillus gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut.  
7470 n. *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

7472

7473 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7474 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7475 assigned the MAG ID F6-6636 and which is available via NCBI BioSample SAMN15816781.  
7476 The GC content of the type genome is 35.69% and the genome length is 1.2 Mbp.

7477

7478

**Description of *Candidatus Paraprevotella stercoravium* sp. nov.**

7480 *Candidatus* Paraprevotella stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
7481 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

7482

7483 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7484 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7485 assigned the MAG ID G3-2149 and which is available via NCBI BioSample SAMN15816669.  
7486 The GC content of the type genome is 45.06% and the genome length is 3.2 Mbp.

7487

7488

**Description of *Candidatus Paraprevotella stercorigallinarum* sp. nov.**

7489 *Candidatus* Paraprevotella stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
7490 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

7492

7493 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7494 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7495 assigned the MAG ID 11093 and which is available via NCBI BioSample SAMN15816852. This  
7496 is a new name for the alphanumeric GTDB species sp900546665. The GC content of the type  
7497 genome is 43.79% and the genome length is 2.9 Mbp.

7498

7499

**Description of *Candidatus Parasutterella gallistercoris* sp. nov.**

7501 *Candidatus* Parasutterella gallistercoris (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n.  
7502 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

7503

7504 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7505 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7506 assigned the MAG ID 21611 and which is available via NCBI BioSample SAMN15816870. This  
7507 is a new name for the alphanumeric GTDB species sp000980495. The GC content of the type  
7508 genome is 49.58% and the genome length is 1.9 Mbp.

7509

7510

7511 **Description of *Candidatus Pelethenecus* gen. nov.**

7512 *Candidatus* Pelethenecus (Pel.eth.en.e'cus. Gr. masc. n. *pelethos* dung; Gr. masc. *enoikos*  
7513 inhabitant; N.L. masc. n. *Pelethenecus* a microbe associated with faeces)

7514

7515 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7516 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7517 species *Pelethenecus faecipullorum*. This is a name for the alphanumeric GTDB genus  
7518 UMGS268. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7519 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Acholeplasmatales* and to the family  
7520 *Anaeroplasmataceae*.

7521

7522

7523 **Description of *Candidatus Pelethenecus faecipullorum* sp. nov.**

7524 *Candidatus* Pelethenecus faecipullorum (ster.co.ri.gal.li.na'rum. L. fem. n. *faex*, *faecis*  
7525 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken  
7526 faeces)

7527

7528 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7529 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7530 assigned the MAG ID ChiW17-6978 and which is available via NCBI BioSample  
7531 SAMN15817226. This is a new name for the alphanumeric GTDB species sp900540175. The  
7532 GC content of the type genome is 39.85% and the genome length is 1.3 Mbp.

7533

7534

7535 **Description of *Candidatus Pelethocola* gen. nov.**

7536 *Candidatus* Pelethocola (Pel.eth.o.co'la. Gr. masc. n. *pelethos* dung; L. suff. *-cola* inhabitant of;  
7537 N.L. fem. n. *Pelethocola* a microbe associated with faeces)

7538

7539 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7540 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7541 species *Pelethocola excrementipullorum*. This is a name for the alphanumeric GTDB genus  
7542 UBA5416. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7543 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
7544 *Lachnospiraceae*.

7545

7546

7547 **Description of *Candidatus Pelethocola excrementipullorum* sp. nov.**

7548 *Candidatus* Pelethocola excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
7549 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
7550 chicken excrement)

7551  
7552 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7553 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7554 assigned the MAG ID CHK160-5124 and which is available via NCBI BioSample  
7555 SAMN15817143. The GC content of the type genome is 43.72% and the genome length is 3.9  
7556 Mbp.

7557

7558

7559 **Description of *Candidatus* Pelethomonas gen. nov.**

7560 *Candidatus* Pelethomonas (Pel.eth.omo'nas. Gr. masc. n. *pelethos* dung; L. fem. n. *monas* a  
7561 monad; N.L. fem. n. *Pelethomonas* a microbe associated with faeces)

7562

7563 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7564 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7565 species *Pelethomonas intestinigallinarum*. This is a name for the alphanumeric GTDB genus  
7566 UMGS1872. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7567 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
7568 *Oscillospiraceae*.

7569

7570

7571 **Description of *Candidatus* Pelethomonas intestinigallinarum sp. nov.**

7572 *Candidatus* Pelethomonas intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
7573 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

7574

7575 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7576 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7577 assigned the MAG ID ChiSjej2B20-3600 and which is available via NCBI BioSample  
7578 SAMN15817014. The GC content of the type genome is 63.89% and the genome length is 2.2  
7579 Mbp.

7580

7581

7582 **Description of *Candidatus* Pelethosoma gen. nov.**

7583 *Candidatus* Pelethosoma (Pel.eth.o.so'ma. Gr. masc. n. *pelethos* dung; Gr. neut. n. *soma* a body;  
7584 N.L. neut. n. *Pelethosoma* a microbe associated with faeces)

7585

7586 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7587 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7588 species *Pelethosoma merdigallinarum*. This is a name for the alphanumeric GTDB genus  
7589 UMGS2016. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
7590 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-822*.

7591

7592

7593 **Description of *Candidatus* Pelethosoma merdigallinarum sp. nov.**

7594 *Candidatus* Pelethosoma merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
7595 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

7596

7597 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7598 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7599 assigned the MAG ID CHK195-5794 and which is available via NCBI BioSample  
7600 SAMN15817039. The GC content of the type genome is 30.57% and the genome length is 1.3  
7601 Mbp.

7602

7603

7604 **Description of *Candidatus* Pelethousia gen. nov.**

7605 *Candidatus* Pelethousia (Pel.eth.ou'si.a. Gr. masc. n. *pelethos* dung; Gr. fem. n. *ousia* an essence;  
7606 N.L. fem. n. *Pelethousia* a microbe associated with faeces)

7607

7608 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7609 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7610 species *Pelethousia gallinarum*. This is a name for the alphanumeric GTDB genus UBA5394.  
7611 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
7612 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family *CAG-*  
7613 *138*.

7614

7615

7616 **Description of *Candidatus* Pelethousia gallinarum sp. nov.**

7617 *Candidatus* Pelethousia gallinarum (gal.li.na'rum. L. fem. n. *gallina* a hen; L. fem. gen.pl. n.  
7618 *gallinarum* of hens)

7619

7620 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7621 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7622 assigned the MAG ID ChiHcec27-1353 and which is available via NCBI BioSample  
7623 SAMN15817178. This is a new name for the alphanumeric GTDB species sp003150565. The  
7624 GC content of the type genome is 59.40% and the genome length is 2.0 Mbp.

7625

7626

7627 **Description of *Candidatus* Phascolarctobacterium stercoravium sp. nov.**

7628 *Candidatus* Phascolarctobacterium stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L.  
7629 fem. n. *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

7630

7631 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7632 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7633 assigned the MAG ID ChiBcec14-732 and which is available via NCBI BioSample  
7634 SAMN15816834. This is a new name for the alphanumeric GTDB species sp000436095. The  
7635 GC content of the type genome is 46.50% and the genome length is 1.7 Mbp.

7636

7637

7638 **Description of *Candidatus* Phocaeicola caecigallarum sp. nov.**

7639 *Candidatus* Phocaeicola caecigallinarum (cae.ci.gal.li.na'rum. L. neut. n. *caecum* the caecum; L.  
7640 fem. n. *gallina* a hen; N.L. gen. n. *caecigallinarum* of the caecum of hens)

7641

7642 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7643 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7644 assigned the MAG ID ChiHjej11B10-3694 and which is available via NCBI BioSample  
7645 SAMN15816802. This is a new name for the alphanumeric GTDB species sp002161565. The  
7646 GC content of the type genome is 46.18% and the genome length is 3.2 Mbp.

7647

7648

7649 **Description of *Candidatus* Phocaeicola excrementigallinarum sp. nov.**

7650 *Candidatus* Phocaeicola excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
7651 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
7652 excrement)

7653

7654 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7655 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7656 assigned the MAG ID 12279 and which is available via NCBI BioSample SAMN15816632. The  
7657 GC content of the type genome is 50.57% and the genome length is 2.5 Mbp.

7658

7659

7660 **Description of *Candidatus* Phocaeicola excrementipullorum sp. nov.**

7661 *Candidatus* Phocaeicola excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
7662 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
7663 chicken excrement)

7664

7665 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7666 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7667 assigned the MAG ID 8470 and which is available via NCBI BioSample SAMN15816808. This  
7668 is a new name for the alphanumeric GTDB species sp900546095. The GC content of the type  
7669 genome is 49.09% and the genome length is 3.1 Mbp.

7670

7671

7672 **Description of *Candidatus* Phocaeicola faecigallinarum sp. nov.**

7673 *Candidatus* Phocaeicola faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
7674 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

7675

7676 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7677 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7678 assigned the MAG ID G4-2901 and which is available via NCBI BioSample SAMN15816657.  
7679 The GC content of the type genome is 40.33% and the genome length is 3.3 Mbp.

7680

7681

7682 **Description of *Candidatus* Phocaeicola faecipullorum sp. nov.**

7683 *Candidatus* Phocaeicola faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
7684 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

7685

7686 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7687 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7688 assigned the MAG ID 17637 and which is available via NCBI BioSample SAMN15816682. The  
7689 GC content of the type genome is 39.94% and the genome length is 3.9 Mbp.

7690

7691

7692 **Description of *Candidatus Phocaeicola gallinarum* sp. nov.**

7693 *Candidatus Phocaeicola gallinarum* (gal.li.na'rum. L. fem. n. *gallina* a hen; L. fem. n. *avis* bird;  
7694 N.L. gen. n. *faecavium* of bird faeces)

7695

7696 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7697 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7698 assigned the MAG ID ChiGjej6B6-595 and which is available via NCBI BioSample  
7699 SAMN15816805. This is a new name for the alphanumeric GTDB species sp900540105. The  
7700 GC content of the type genome is 45.79% and the genome length is 2.8 Mbp.

7701

7702

7703 **Description of *Candidatus Phocaeicola gallistercoris* sp. nov.**

7704 *Candidatus Phocaeicola gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
7705 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

7706

7707 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7708 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7709 assigned the MAG ID Gambia9-593 and which is available via NCBI BioSample  
7710 SAMN15816698. The GC content of the type genome is 38.34% and the genome length is 2.3  
7711 Mbp.

7712

7713

7714 **Description of *Candidatus Phocaeicola merdavium* sp. nov.**

7715 *Candidatus Phocaeicola merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
7716 N.L. gen. n. *merdavium* of bird faeces)

7717

7718 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7719 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7720 assigned the MAG ID CHK136-5299 and which is available via NCBI BioSample  
7721 SAMN15816804. This is a new name for the alphanumeric GTDB species sp002161765. The  
7722 GC content of the type genome is 44.54% and the genome length is 2.6 Mbp.

7723

7724

7725 **Description of *Candidatus Phocaeicola merdigallinarum* sp. nov.**

7726 *Candidatus Phocaeicola merdigallinarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
7727 n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

7728

7729 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7730 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

7731 assigned the MAG ID 17689 and which is available via NCBI BioSample SAMN15816829. This  
7732 is a new name for the alphanumeric GTDB species sp900066455. The GC content of the type  
7733 genome is 46.19% and the genome length is 3.3 Mbp.

7734  
7735

7736 **Description of *Candidatus Prevotella avicola* sp. nov.**

7737 *Candidatus* Prevotella avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
7738 *avicola* inhabitant of birds)

7739

7740 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7741 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7742 assigned the MAG ID ChiHecec3B27-8219 and which is available via NCBI BioSample  
7743 SAMN15816846. This is a new name for the alphanumeric GTDB species sp000435635. The  
7744 GC content of the type genome is 51.22% and the genome length is 1.9 Mbp.

7745  
7746

7747 **Description of *Candidatus Prevotella intestinigallinarum* sp. nov.**

7748 *Candidatus* Prevotella intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut; L.  
7749 fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

7750

7751 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7752 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7753 assigned the MAG ID 146 and which is available via NCBI BioSample SAMN15816872. This is  
7754 a new name for the alphanumeric GTDB species sp900540415. The GC content of the type  
7755 genome is 56.37% and the genome length is 2.9 Mbp.

7756  
7757

7758 **Description of *Candidatus Prevotella stercoripullorum* sp. nov.**

7759 *Candidatus* Prevotella stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L. masc.  
7760 n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

7761

7762 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7763 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7764 assigned the MAG ID USASDec6-549 and which is available via NCBI BioSample  
7765 SAMN15816866. This is a new name for the alphanumeric GTDB species sp900554045. The  
7766 GC content of the type genome is 53.35% and the genome length is 2.5 Mbp.

7767  
7768

7769 **Description of *Candidatus Protoclostridium stercorigallinarum* sp. nov.**

7770 *Candidatus* Protoclostridium stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung;  
7771 L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

7772

7773 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7774 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7775 assigned the MAG ID 12435 and which is available via NCBI BioSample SAMN15816772. The  
7776 GC content of the type genome is 56.70% and the genome length is 1.7 Mbp.

7777

7778

**Description of *Candidatus Pseudogracilibacillus intestinigallinarum* sp. nov.**7780 *Candidatus* Pseudogracilibacillus intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n.7781 *intestinum* gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

7782

7783 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7784 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7785 assigned the MAG ID CHK169-2315 and which is available via NCBI BioSample  
7786 SAMN15816775. The GC content of the type genome is 35.03% and the genome length is 2.5  
7787 Mbp.

7788

7789

**Description of *Candidatus Pseudomonas excrementavium* sp. nov.**7791 *Candidatus* Pseudomonas excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*7792 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

7793

7794 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7795 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7796 assigned the MAG ID CHK174-787 and which is available via NCBI BioSample  
7797 SAMN15816898. Although GTDB has assigned this species to the genus it calls  
7798 *Pseudomonas\_D*, this genus designation cannot be incorporated into a well-formed binomial, so  
7799 in naming this species, we have used the current validly published name for the genus. The GC  
7800 content of the type genome is 61.84% and the genome length is 3.0 Mbp.

7801

7802

**Description of *Candidatus Pullibacteroides* gen. nov.**7803 *Candidatus* Pullibacteroides (Pul.li.bac.te.ro'i.des. L. masc. n. *pullus* a young chicken; N.L.7805 masc. n. *Bacteroides* a genus name; N.L. masc. n. *Pullibacteroides* a genus related to the genus7806 *Bacteroides* but distinct from it and found in poultry)

7807

7808 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7809 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7810 species *Pullibacteroides excrementavium*. This genus has been assigned by GTDB-Tk v1.3.0  
7811 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order  
7812 *Bacteroidales* and to the family *P3*.

7813

7814

**Description of *Candidatus Pullibacteroides excrementavium* sp. nov.**7816 *Candidatus* Pullibacteroides excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*7817 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

7818

7819 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7820 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7821 assigned the MAG ID 2889 and which is available via NCBI BioSample SAMN15816989. The  
7822 GC content of the type genome is 51.34% and the genome length is 2.4 Mbp.

7823

7824

**7825 Description of *Candidatus Pullichristensenella* gen. nov.**

7826 *Candidatus Pullichristensenella* (Pul.li.chris.ten.sen.el'la. L. masc. n. *pullus* a young chicken;  
7827 N.L. fem. n. *Christensenella* a genus name; N.L. fem. n. *Pullichristensenella* a genus related to  
7828 the genus *Christensenella* but distinct from it and found in poultry)

7829

7830 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7831 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7832 species *Pullichristensenella avicola*. This genus has been assigned by GTDB-Tk v1.3.0 working  
7833 on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order

7834 *Christensenellales* and to the family *CAG-74*.

7835

7836

**7837 Description of *Candidatus Pullichristensenella avicola* sp. nov.**

7838 *Candidatus Pullichristensenella avicola* (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant  
7839 of; N.L. n. *avicola* inhabitant of birds)

7840

7841 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7842 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7843 assigned the MAG ID 10205 and which is available via NCBI BioSample SAMN15816956. The  
7844 GC content of the type genome is 63.02% and the genome length is 2.3 Mbp.

7845

7846

**7847 Description of *Candidatus Pullichristensenella excrementigallarum* sp. nov.**

7848 *Candidatus Pullichristensenella excrementigallarum* (ex.cre.men.ti.gal.li'na'rum. L. neut. n.  
7849 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
7850 excrement)

7851

7852 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7853 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7854 assigned the MAG ID ChiHcec3-11533 and which is available via NCBI BioSample  
7855 SAMN15816983. The GC content of the type genome is 57.19% and the genome length is 2.2  
7856 Mbp.

7857

7858

**7859 Description of *Candidatus Pullichristensenella excrementipullorum* sp. nov.**

7860 *Candidatus Pullichristensenella excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
7861 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
7862 young chicken excrement)

7863

7864 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7865 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7866 assigned the MAG ID 1279 and which is available via NCBI BioSample SAMN15817001. The  
7867 GC content of the type genome is 63.33% and the genome length is 2.7 Mbp.

7868

7869

**Description of *Candidatus Pullichristensenella stercorigallinarum* sp. nov.**

7871 *Candidatus Pullichristensenella stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
7872 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

7873

7874 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7875 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7876 assigned the MAG ID ChiSjej6B24-2974 and which is available via NCBI BioSample  
7877 SAMN15816933. The GC content of the type genome is 60.06% and the genome length is 2.7  
7878 Mbp.

7879

7880

**Description of *Candidatus Pullichristensenella stercoripullorum* sp. nov.**

7882 *Candidatus Pullichristensenella stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung;  
7883 L. masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young  
7884 chickens)

7885

7886 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7887 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7888 assigned the MAG ID 5266 and which is available via NCBI BioSample SAMN15816952. The  
7889 GC content of the type genome is 64.02% and the genome length is 2.3 Mbp.

7890

7891

**Description of *Candidatus Pullilachnospira* gen. nov.**

7893 *Candidatus Pullilachnospira* (Pul.li.lach.no.spi'ra. L. masc. n. *pullus* a young chicken; N.L. fem.  
7894 n. *Lachnospira* a genus name; N.L. fem. n. *Pullilachnospira* a genus related to the genus  
7895 *Lachnospira* but distinct from it and found in poultry)

7896

7897 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
7898 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
7899 species *Pullilachnospira stercoravium*. This genus was identified but not named by Glendinning  
7900 et al. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
7901 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
7902 *Lachnospiraceae*.

7903

7904

**Description of *Candidatus Pullilachnospira gallistercoris* sp. nov.**

7906 *Candidatus Pullilachnospira gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
7907 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

7908

7909 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7910 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7911 assigned the MAG ID ChiSjej5B23-6657 and which is available via NCBI BioSample  
7912 SAMN15816936. The GC content of the type genome is 53.36% and the genome length is 2.5  
7913 Mbp.

7914

7915

**7916 Description of *Candidatus Pullilachnospira intestinigallinarum* sp. nov.**

7917 *Candidatus* Pullilachnospira intestinigallinarum (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum*  
7918 gut; L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

7919

7920 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7921 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7922 assigned the MAG ID CHK192-16996 and which is available via NCBI BioSample  
7923 SAMN15816938. The GC content of the type genome is 51.71% and the genome length is 2.8  
7924 Mbp.

7925

7926

**7927 Description of *Candidatus Pullilachnospira stercoravium* sp. nov.**

7928 *Candidatus* Pullilachnospira stercoravium (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n.  
7929 *avis* bird; N.L. gen. n. *stercoravium* of bird faeces)

7930

7931 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7932 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7933 assigned the MAG ID ChiBcec2-4451 and which is available via NCBI BioSample  
7934 SAMN15816944. The GC content of the type genome is 53.14% and the genome length is 2.8  
7935 Mbp.

7936

7937

**7938 Description of *Candidatus Pygmaibacter gallistercoris* sp. nov.**

7939 *Candidatus* Pygmaibacter gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
7940 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

7941

7942 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7943 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7944 assigned the MAG ID ChiGjej6B6-17065 and which is available via NCBI BioSample  
7945 SAMN15816776. The GC content of the type genome is 61.74% and the genome length is 1.6  
7946 Mbp.

7947

7948

**7949 Description of *Candidatus Rikenella faecigallinarum* sp. nov.**

7950 *Candidatus* Rikenella faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
7951 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

7952

7953 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7954 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7955 assigned the MAG ID ChiBcec15-1070 and which is available via NCBI BioSample  
7956 SAMN15816768. The GC content of the type genome is 56.15% and the genome length is 1.8  
7957 Mbp.

7958

7959

**7960 Description of *Candidatus Rothia avicola* sp. nov.**

7961 *Candidatus* Rothia avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L. n.  
7962 *avicola* inhabitant of birds)

7963

7964 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7965 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7966 assigned the MAG ID ChiHjej12B11-9195 and which is available via NCBI BioSample  
7967 SAMN15816701. The GC content of the type genome is 60.05% and the genome length is 2.1  
7968 Mbp.

7969

7970

7971 **Description of *Candidatus* Rothia avistercoris sp. nov.**

7972 *Candidatus* Rothia avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung; N.L.  
7973 gen. n. *avistercoris* of bird faeces)

7974

7975 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7976 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7977 assigned the MAG ID ChiHjej10B9-4811 and which is available via NCBI BioSample  
7978 SAMN15816788. The GC content of the type genome is 59.79% and the genome length is 2.0  
7979 Mbp.

7980

7981

7982 **Description of *Candidatus* Ruania gallistercoris sp. nov.**

7983 *Candidatus* Ruania gallistercoris (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n. *stercus*  
7984 dung; N.L. gen. n. *gallistercoris* of chicken faeces)

7985

7986 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7987 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7988 assigned the MAG ID ChiGjej4B4-7305 and which is available via NCBI BioSample  
7989 SAMN15816695. The GC content of the type genome is 69.62% and the genome length is 4.4  
7990 Mbp.

7991

7992

7993 **Description of *Candidatus* Rubneribacter avistercoris sp. nov.**

7994 *Candidatus* Rubneribacter avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
7995 dung; N.L. gen. n. *avistercoris* of bird faeces)

7996

7997 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
7998 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
7999 assigned the MAG ID ChiGjej6B6-20359 and which is available via NCBI BioSample  
8000 SAMN15816703. The GC content of the type genome is 65.17% and the genome length is 3.2  
8001 Mbp.

8002

8003

8004 **Description of *Candidatus* Ruminococcus avistercoris sp. nov.**

8005 *Candidatus* Ruminococcus avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus*  
8006 dung; N.L. gen. n. *avistercoris* of bird faeces)

8007

8008 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8009 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8010 assigned the MAG ID CHK186-6582 and which is available via NCBI BioSample  
8011 SAMN15816883. Although GTDB has assigned this species to the genus it calls  
8012 *Ruminococcus\_G*, this genus designation cannot be incorporated into a well-formed binomial,  
8013 so in naming this species, we have used the current validly published name for the genus. The  
8014 GC content of the type genome is 50.07% and the genome length is 2.3 Mbp.

8015

8016

8017 **Description of *Candidatus Ruminococcus gallistercoris* sp. nov.**

8018 *Candidatus Ruminococcus gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
8019 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

8020

8021 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8022 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8023 assigned the MAG ID ChiBcec12-341 and which is available via NCBI BioSample  
8024 SAMN15816918. This is a new name for the alphanumeric GTDB species sp900552925.

8025 Although GTDB has assigned this species to the genus it calls *Ruminococcus\_H*, this genus  
8026 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
8027 have used the current validly published name for the genus. The GC content of the type genome  
8028 is 62.03% and the genome length is 2.1 Mbp.

8029

8030

8031 **Description of *Candidatus Ruminococcus intestinipullorum* sp. nov.**

8032 *Candidatus Ruminococcus intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
8033 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

8034

8035 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8036 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8037 assigned the MAG ID 1485 and which is available via NCBI BioSample SAMN15816905.

8038 Although GTDB has assigned this species to the genus it calls *Ruminococcus\_B*, this genus  
8039 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
8040 have used the current validly published name for the genus. The GC content of the type genome  
8041 is 35.77% and the genome length is 2.1 Mbp.

8042

8043

8044 **Description of *Candidatus Ruthenibacterium avium* sp. nov.**

8045 *Candidatus Ruthenibacterium avium* (a'vi.um. L. fem. pl. n. *avium* of birds)

8046

8047 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8048 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8049 assigned the MAG ID ChiBcec8-14828 and which is available via NCBI BioSample  
8050 SAMN15816823. This is a new name for the alphanumeric GTDB species sp002315015. The  
8051 GC content of the type genome is 51.27% and the genome length is 2.2 Mbp.

8052

8053

**8054 Description of *Candidatus Ruthenibacterium merdavium* sp. nov.**

8055 *Candidatus* Ruthenibacterium merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
8056 bird; N.L. gen. n. *merdavium* of bird faeces)

8057

8058 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8059 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8060 assigned the MAG ID 5933 and which is available via NCBI BioSample SAMN15816578. The  
8061 GC content of the type genome is 51.15% and the genome length is 2.0 Mbp.

8062

8063

**8064 Description of *Candidatus Ruthenibacterium merdigallarum* sp. nov.**

8065 *Candidatus* Ruthenibacterium merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
8066 fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

8067

8068 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8069 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8070 assigned the MAG ID ChiSje6B24-7098 and which is available via NCBI BioSample  
8071 SAMN15816763. The GC content of the type genome is 65.28% and the genome length is 2.2  
8072 Mbp.

8073

8074

**8075 Description of *Candidatus Ruthenibacterium merdipullorum* sp. nov.**

8076 *Candidatus* Ruthenibacterium merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L.  
8077 masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

8078

8079 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8080 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8081 assigned the MAG ID ChiSxje5B17-15602 and which is available via NCBI BioSample  
8082 SAMN15816878. This is a new name for the alphanumeric GTDB species sp900546885. The  
8083 GC content of the type genome is 59.69% and the genome length is 2.1 Mbp.

8084

8085

**8086 Description of *Candidatus Salinicoccus merdavium* sp. nov.**

8087 *Candidatus* Salinicoccus merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
8088 N.L. gen. n. *merdavium* of bird faeces)

8089

8090 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8091 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8092 assigned the MAG ID ChiHje12B11-20095 and which is available via NCBI BioSample  
8093 SAMN15816874. This is a new name for the alphanumeric GTDB species sp002360325. The  
8094 GC content of the type genome is 44.20% and the genome length is 1.8 Mbp.

8095

8096

**8097 Description of *Candidatus Salinicoccus stercoripullorum* sp. nov.**

8098 *Candidatus* Salinicoccus stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
8099 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)  
8100

8101 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8102 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8103 assigned the MAG ID ChiHjej13B12-752 and which is available via NCBI BioSample  
8104 SAMN15816771. The GC content of the type genome is 48.14% and the genome length is 2.3  
8105 Mbp.

8106  
8107

8108 **Description of *Candidatus* Savagella gallinarum sp. nov.**

8109 *Candidatus* Savagella gallinarum (gal.li.na'rum. L. fem. n. *gallina* a hen; L. fem. n. *gallina* hen;  
8110 L. gen.pl. n. *gallinarum* of hens)

8111

8112 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8113 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8114 assigned the MAG ID CHK166-5537 and which is available via NCBI BioSample  
8115 SAMN15816803. This is a new name for the alphanumeric GTDB species sp001655775. The  
8116 GC content of the type genome is 26.42% and the genome length is 1.8 Mbp.

8117

8118

8119 **Description of *Candidatus* Scatarchaeum gen. nov.**

8120 *Candidatus* Scatarchaeum (Scat.archaeum. Gr. neut. n. *skor*, *skatos* dung; N.L. neut. n. *archaeum*  
8121 an archaeon; N.L. neut. n. *Scatarchaeum* a microbe associated with faeces)

8122

8123 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8124 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8125 species *Scatarchaeum merdigallinarum*. This is a name for the alphanumeric GTDB genus  
8126 UMGS403. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8127 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
8128 *Acutalibacteraceae*.

8129

8130

8131 **Description of *Candidatus* Scatarchaeum merdigallinarum sp. nov.**

8132 *Candidatus* Scatarchaeum merdigallinarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
8133 fem. n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

8134

8135 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8136 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8137 assigned the MAG ID ChiSjej1B19-3389 and which is available via NCBI BioSample  
8138 SAMN15817212. This is a new name for the alphanumeric GTDB species sp900541975. The  
8139 GC content of the type genome is 46.67% and the genome length is 1.7 Mbp.

8140

8141

8142 **Description of *Candidatus* Scatenecus gen. nov.**

8143 *Candidatus Scatenecus* (Scat.en.e'cus. Gr. neut. n. *skor*, *skatos* dung; Gr. masc. *enoikos*  
8144 inhabitant; N.L. masc. n. *Scatenecus* a microbe associated with the intestines)

8145  
8146 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8147 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8148 species *Scatenecus faecavium*. This is a name for the alphanumeric GTDB genus QAMI01. This  
8149 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
8150 al., 2019; Parks et al., 2020) to the order *Gastranaerophilales* and to the family  
8151 *Gastranaerophilaceae*.

8152  
8153

8154 **Description of *Candidatus Scatenecus faecavium* sp. nov.**

8155 *Candidatus Scatenecus faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8156 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8157

8158 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8159 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8160 assigned the MAG ID CHK152-2994 and which is available via NCBI BioSample  
8161 SAMN15817221. This is a new name for the alphanumeric GTDB species sp900551915. The  
8162 GC content of the type genome is 37.15% and the genome length is 1.9 Mbp.

8163  
8164

8165 **Description of *Candidatus Scatocola* gen. nov.**

8166 *Candidatus Scatocola* (Scat.o.co'la. Gr. neut. n. *skor*, *skatos* dung; L. suff. *-cola* inhabitant of;  
8167 N.L. fem. n. *Scatocola* a microbe associated with faeces)

8168

8169 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8170 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8171 species *Scatocola faecipullorum*. This is a name for the alphanumeric GTDB genus CAG-495.  
8172 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8173 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF32* and to the family *CAG-239*.

8174  
8175

8176 **Description of *Candidatus Scatocola faecigallinarum* sp. nov.**

8177 *Candidatus Scatocola faecigallinarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement; L.  
8178 fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

8179

8180 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8181 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8182 assigned the MAG ID 2846 and which is available via NCBI BioSample SAMN15817209. This  
8183 is a new name for the alphanumeric GTDB species sp000436375. The GC content of the type  
8184 genome is 49.31% and the genome length is 1.7 Mbp.

8185  
8186

8187 **Description of *Candidatus Scatocola faecipullorum* sp. nov.**

8188 *Candidatus* Scatocola faecipullorum (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
8189 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

8190

8191 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8192 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8193 assigned the MAG ID ChiW3-316 and which is available via NCBI BioSample  
8194 SAMN15817201. This is a new name for the alphanumeric GTDB species sp001917125. The  
8195 GC content of the type genome is 47.24% and the genome length is 1.7 Mbp.

8196

8197

8198 **Description of *Candidatus* Scatomonas gen. nov.**

8199 *Candidatus* Scatomonas (Scat.o.mo'nas. Gr. neut. n. *skor*, *skatos* dung; L. fem. n. *monas* a  
8200 monad; N.L. fem. n. *Scatomonas* a microbe associated with the intestines)

8201

8202 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8203 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8204 species *Scatomonas merdigallarum*. This is a name for the alphanumeric GTDB genus OF09-  
8205 33XD. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8206 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
8207 *Lachnospiraceae*.

8208

8209

8210 **Description of *Candidatus* Scatomonas merdavium sp. nov.**

8211 *Candidatus* Scatomonas merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
8212 N.L. gen. n. *merdavium* of bird faeces)

8213

8214 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8215 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8216 assigned the MAG ID ChiSje5B23-9500 and which is available via NCBI BioSample  
8217 SAMN15817033. The GC content of the type genome is 53.14% and the genome length is 2.3  
8218 Mbp.

8219

8220

8221 **Description of *Candidatus* Scatomonas merdigallarum sp. nov.**

8222 *Candidatus* Scatomonas merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
8223 n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

8224

8225 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8226 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8227 assigned the MAG ID CHK191-20366 and which is available via NCBI BioSample  
8228 SAMN15817035. The GC content of the type genome is 53.29% and the genome length is 2.3  
8229 Mbp.

8230

8231

8232 **Description of *Candidatus* Scatomonas pullistercoris sp. nov.**

8233 *Candidatus Scatomonas pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
8234 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

8235  
8236 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8237 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8238 assigned the MAG ID CHK188-20938 and which is available via NCBI BioSample  
8239 SAMN15817052. The GC content of the type genome is 53.16% and the genome length is 2.3  
8240 Mbp.

8241  
8242

8243 **Description of *Candidatus Scatomorpha* gen. nov.**

8244 *Candidatus Scatomorpha* (Scat.o.mor'pha. Gr. neut. n. *skor*, *skatos* dung; Gr. fem. n. *morphe* a  
8245 form, shape; N.L. fem. n. *Scatomorpha* a microbe associated with faeces)

8246

8247 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8248 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8249 species *Scatomorpha merdavium*. This is a name for the alphanumeric GTDB genus UBA5446.  
8250 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8251 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
8252 *Oscillospiraceae*.

8253  
8254

8255 **Description of *Candidatus Scatomorpha gallistercoris* sp. nov.**

8256 *Candidatus Scatomorpha gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
8257 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

8258

8259 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8260 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8261 assigned the MAG ID ChiHjej12B11-5383 and which is available via NCBI BioSample  
8262 SAMN15817213. This is a new name for the alphanumeric GTDB species sp900544765. The  
8263 GC content of the type genome is 60.13% and the genome length is 2.4 Mbp.

8264  
8265

8266 **Description of *Candidatus Scatomorpha intestinavium* sp. nov.**

8267 *Candidatus Scatomorpha intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n.  
8268 *avis* bird; N.L. gen. n. *intestinavium* of the gut of birds)

8269

8270 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8271 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8272 assigned the MAG ID ChiBcolR7-354 and which is available via NCBI BioSample  
8273 SAMN15817058. The GC content of the type genome is 62.47% and the genome length is 2.0  
8274 Mbp.

8275  
8276

8277 **Description of *Candidatus Scatomorpha intestinigallarum* sp. nov.**

8278 *Candidatus Scatomorpha intestinigallinarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
8279 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallinarum* of the gut of the hens)

8280  
8281 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8282 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8283 assigned the MAG ID ChiGjej3B3-7149 and which is available via NCBI BioSample  
8284 SAMN15817216. This is a new name for the alphanumeric GTDB species sp900544295. The  
8285 GC content of the type genome is 63.01% and the genome length is 2.3 Mbp.

8286  
8287

8288 **Description of *Candidatus Scatomorpha intestinipullorum* sp. nov.**

8289 *Candidatus Scatomorpha intestinipullorum* (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
8290 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

8291

8292 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8293 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8294 assigned the MAG ID CHK1-1240 and which is available via NCBI BioSample  
8295 SAMN15817022. The GC content of the type genome is 61.56% and the genome length is 2.5  
8296 Mbp.

8297

8298

8299 **Description of *Candidatus Scatomorpha merdaviium* sp. nov.**

8300 *Candidatus Scatomorpha merdaviium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
8301 bird; N.L. gen. n. *merdaviium* of bird faeces)

8302

8303 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8304 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8305 assigned the MAG ID ChiSxjej3B15-13231 and which is available via NCBI BioSample  
8306 SAMN15817220. This is a new name for the alphanumeric GTDB species sp004553625. The  
8307 GC content of the type genome is 61.38% and the genome length is 2.3 Mbp.

8308

8309

8310 **Description of *Candidatus Scatomorpha merdigallinarum* sp. nov.**

8311 *Candidatus Scatomorpha merdigallinarum* (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L. fem.  
8312 n. *gallina* hen; N.L. gen. n. *merdigallinarum* of hen faeces)

8313

8314 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8315 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8316 assigned the MAG ID CHK187-5235 and which is available via NCBI BioSample  
8317 SAMN15817028. The GC content of the type genome is 58.23% and the genome length is 2.3  
8318 Mbp.

8319

8320

8321 **Description of *Candidatus Scatomorpha merdipullorum* sp. nov.**

8322 *Candidatus Scatomorpha merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
8323 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

8324

8325 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8326 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8327 assigned the MAG ID ChiHjej10B9-9673 and which is available via NCBI BioSample  
8328 SAMN15817099. The GC content of the type genome is 64.45% and the genome length is 1.8  
8329 Mbp.

8330

8331

8332 **Description of *Candidatus Scatomorpha pullicola* sp. nov.**

8333 *Candidatus Scatomorpha pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
8334 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

8335

8336 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8337 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8338 assigned the MAG ID ChiSjej5B23-7677 and which is available via NCBI BioSample  
8339 SAMN15817223. This is a new name for the alphanumeric GTDB species sp900543085. The  
8340 GC content of the type genome is 62.30% and the genome length is 2.1 Mbp.

8341

8342

8343 **Description of *Candidatus Scatomorpha pullistercoris* sp. nov.**

8344 *Candidatus Scatomorpha pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
8345 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

8346

8347 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8348 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8349 assigned the MAG ID ChiHecec3B27-6122 and which is available via NCBI BioSample  
8350 SAMN15817222. This is a new name for the alphanumeric GTDB species sp900546615. The  
8351 GC content of the type genome is 61.20% and the genome length is 2.2 Mbp.

8352

8353

8354 **Description of *Candidatus Scatomorpha stercoravium* sp. nov.**

8355 *Candidatus Scatomorpha stercoravium* (ster.cor.a'vi.um. L. neut. n. *stercus* dung; L. fem. n. *avis*  
8356 bird; N.L. gen. n. *stercoravium* of bird faeces)

8357

8358 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8359 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8360 assigned the MAG ID ChiHecec3B27-8609 and which is available via NCBI BioSample  
8361 SAMN15817107. The GC content of the type genome is 64.50% and the genome length is 2.0  
8362 Mbp.

8363

8364

8365 **Description of *Candidatus Scatomorpha stercorigallinarum* sp. nov.**

8366 *Candidatus Scatomorpha stercorigallinarum* (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* dung; L.  
8367 fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

8368

8369 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8370 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8371 assigned the MAG ID ChiHjej9B8-2268 and which is available via NCBI BioSample  
8372 SAMN15817162. The GC content of the type genome is 64.82% and the genome length is 2.0  
8373 Mbp.

8374  
8375

8376 **Description of *Candidatus Scatoplasma* gen. nov.**

8377 *Candidatus Scatoplasma* (Scat.o.plas'ma. Gr. neut. n. *skor*, *skatos* dung; Gr. neut. n. *plasma* a  
8378 form; N.L. neut. n. *Scatoplasma* a microbe associated with faeces)

8379

8380 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8381 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8382 species *Scatoplasma merdavium*. This is a name for the alphanumeric GTDB genus UBA6879.  
8383 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8384 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFN20* and to the family *CAG-288*.

8385  
8386

8387 **Description of *Candidatus Scatoplasma merdavium* sp. nov.**

8388 *Candidatus Scatoplasma merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
8389 N.L. gen. n. *merdavium* of bird faeces)

8390

8391 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8392 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8393 assigned the MAG ID 1748 and which is available via NCBI BioSample SAMN15817159. The  
8394 GC content of the type genome is 36.99% and the genome length is 1.0 Mbp.

8395  
8396

8397 **Description of *Candidatus Scatosoma* gen. nov.**

8398 *Candidatus Scatosoma* (Scat.o.so'ma. Gr. neut. n. *skor*, *skatos* dung; Gr. neut. n. *soma* a body;  
8399 N.L. neut. n. *Scatosoma* a microbe associated with the intestines)

8400

8401 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8402 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8403 species *Scatosoma pullicola*. This is a name for the alphanumeric GTDB genus QALS01. This  
8404 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
8405 al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family *Borkfalkiaceae*.

8406  
8407

8408 **Description of *Candidatus Scatosoma pullicola* sp. nov.**

8409 *Candidatus Scatosoma pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. *-cola*  
8410 inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

8411

8412 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8413 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8414 assigned the MAG ID CHK183-20193 and which is available via NCBI BioSample

8415 SAMN15817013. The GC content of the type genome is 57.19% and the genome length is 2.0  
8416 Mbp.

8417

8418

8419 **Description of *Candidatus Scatosoma pullistercoris* sp. nov.**

8420 *Candidatus Scatosoma pullistercoris* (pul.li.ster'co.ris. L. masc. n. *pullus* a young chicken; L.  
8421 neut. n. *stercus* dung; N.L. gen. n. *pullistercoris* of young chicken faeces)

8422

8423 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8424 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8425 assigned the MAG ID 11687 and which is available via NCBI BioSample SAMN15817138. The  
8426 GC content of the type genome is 55.35% and the genome length is 1.5 Mbp.

8427

8428

8429 **Description of *Candidatus Scatousia* gen. nov.**

8430 *Candidatus Scatousia* (Scat.ou'si.a. Gr. neut. n. *skor*, *skatos* dung; Gr. fem. n. *ousia* an essence;  
8431 N.L. fem. n. *Scatousia* a microbe associated with faeces)

8432

8433 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8434 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8435 species *Scatousia excrementipullorum*. This is a name for the alphanumeric GTDB genus CAG-  
8436 484. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8437 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Gastranaerophilales* and to the family  
8438 *Gastranaerophilaceae*.

8439

8440

8441 **Description of *Candidatus Scatousia excrementigallinarum* sp. nov.**

8442 *Candidatus Scatousia excrementigallinarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n. *excrementum*  
8443 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen excrement)

8444

8445 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8446 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8447 assigned the MAG ID 6276 and which is available via NCBI BioSample SAMN15817091. The  
8448 GC content of the type genome is 36.46% and the genome length is 2.8 Mbp.

8449

8450

8451 **Description of *Candidatus Scatousia excrementipullorum* sp. nov.**

8452 *Candidatus Scatousia excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
8453 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
8454 chicken excrement)

8455

8456 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8457 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8458 assigned the MAG ID 10192 and which is available via NCBI BioSample SAMN15817157. The  
8459 GC content of the type genome is 36.06% and the genome length is 1.8 Mbp.

8460

8461

8462 **Description of *Candidatus Scatovicinus* gen. nov.**

8463 *Candidatus Scatovicinus* (Scat.o.vic.in'us. Gr. neut. n. *skor*, *skatos* dung; L. masc. n. *vicinus* a  
8464 neighbour; N.L. masc. n. *Scatovicinus* a microbe associated with faeces)

8465

8466 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8467 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8468 species *Scatovicinus merdipullorum*. This is a name for the alphanumeric GTDB genus  
8469 UMG5403. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8470 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
8471 *Acutalibacteraceae*.

8472

8473

8474 **Description of *Candidatus Scatovicinus merdipullorum* sp. nov.**

8475 *Candidatus Scatovicinus merdipullorum* (mer.di.pul.lo'rum. L. fem. n. *merda* faeces; L. masc. n.  
8476 *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

8477

8478 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8479 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8480 assigned the MAG ID CHK181-9830 and which is available via NCBI BioSample  
8481 SAMN15817214. This is a new name for the alphanumeric GTDB species sp900541565. The  
8482 GC content of the type genome is 46.80% and the genome length is 1.9 Mbp.

8483

8484

8485 **Description of *Candidatus Scatovivens* gen. nov.**

8486 *Candidatus Scatovivens* (Scat.o.viv'ens. Gr. neut. n. *skor*, *skatos* dung; N.L. pres. part. *vivens*  
8487 living; N.L. fem. n. *Scatovivens* a microbe associated with faeces)

8488

8489 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8490 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8491 species *Scatovivens faecipullorum*. This is a name for the alphanumeric GTDB genus UBA7001.  
8492 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8493 (Chaumeil et al., 2019; Parks et al., 2020) to the order *TANB77* and to the family *CAG-508*.

8494

8495

8496 **Description of *Candidatus Scatovivens faecipullorum* sp. nov.**

8497 *Candidatus Scatovivens faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
8498 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

8499

8500 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8501 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8502 assigned the MAG ID ChiSxjej5B17-16517 and which is available via NCBI BioSample  
8503 SAMN15817189. This is a new name for the alphanumeric GTDB species sp900553685. The  
8504 GC content of the type genome is 25.63% and the genome length is 1.9 Mbp.

8505

8506

8507 **Description of *Candidatus Scubalenecus merdavium* sp. nov.**

8508 *Candidatus Scubalenecus merdavium* (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
8509 bird; N.L. gen. n. *merdavium* of bird faeces)

8510  
8511 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8512 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8513 assigned the MAG ID CHK176-6737 and which is available via NCBI BioSample  
8514 SAMN15817203. This is a new name for the alphanumeric GTDB species sp900546735. The  
8515 GC content of the type genome is 52.55% and the genome length is 1.8 Mbp.

8516  
8517

8518 **Description of *Candidatus Scubalocola faecavium* sp. nov.**

8519 *Candidatus Scubalocola faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8520 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8521  
8522 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8523 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8524 assigned the MAG ID CHK196-3395 and which is available via NCBI BioSample  
8525 SAMN15817004. The GC content of the type genome is 45.55% and the genome length is 3.6  
8526 Mbp.

8527  
8528

8529 **Description of *Candidatus Scubalocola faecigallarum* sp. nov.**

8530 *Candidatus Scubalocola faecigallarum* (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
8531 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallarum* of hen faeces)

8532  
8533 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8534 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8535 assigned the MAG ID CHK178-757 and which is available via NCBI BioSample  
8536 SAMN15817027. The GC content of the type genome is 46.78% and the genome length is 3.5  
8537 Mbp.

8538  
8539

8540 **Description of *Candidatus Scubalocola faecipullorum* sp. nov.**

8541 *Candidatus Scubalocola faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
8542 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

8543  
8544 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8545 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8546 assigned the MAG ID CHK194-7924 and which is available via NCBI BioSample  
8547 SAMN15817034. The GC content of the type genome is 44.36% and the genome length is 2.5  
8548 Mbp.

8549  
8550

8551 **Description of *Candidatus Scubalomonas excrementavium* sp. nov.**

8552 *Candidatus Scubalomonas excrementavium* (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
8553 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

8554

8555 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8556 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8557 assigned the MAG ID E3-2379 and which is available via NCBI BioSample SAMN15817094.  
8558 The GC content of the type genome is 32.78% and the genome length is 2.5 Mbp.

8559

8560

8561 **Description of *Candidatus Scubalomonas excrementigallarum* sp. nov.**

8562 *Candidatus Scubalomonas excrementigallarum* (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
8563 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen  
8564 excrement)

8565

8566 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8567 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8568 assigned the MAG ID 3201 and which is available via NCBI BioSample SAMN15817095. The  
8569 GC content of the type genome is 34.32% and the genome length is 3.2 Mbp.

8570

8571

8572 **Description of *Candidatus Scubalosoma faecavium* sp. nov.**

8573 *Candidatus Scubalosoma faecavium* (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8574 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8575

8576 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8577 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8578 assigned the MAG ID ChiSxjej1B13-2233 and which is available via NCBI BioSample  
8579 SAMN15817224. This is a new name for the alphanumeric GTDB species sp900545085. The  
8580 GC content of the type genome is 47.85% and the genome length is 1.6 Mbp.

8581

8582

8583 **Description of *Candidatus Scubalousia intestinigallarum* sp. nov.**

8584 *Candidatus Scubalousia intestinigallarum* (in.tes.ti.ni.gal.li.na'rum. L. neut. n. *intestinum* gut;  
8585 L. fem. n. *gallina* hen; N.L. gen. n. *intestinigallarum* of the gut of the hens)

8586

8587 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8588 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8589 assigned the MAG ID CHK193-12526 and which is available via NCBI BioSample  
8590 SAMN15817037. The GC content of the type genome is 31.54% and the genome length is 1.5  
8591 Mbp.

8592

8593

8594 **Description of *Candidatus Scybalenecus* gen. nov.**

8595 *Candidatus Scybalenecus* (Scy.bal.en.e'cus. Gr. neut. n. *scybalon* dung; Gr. masc. *enoikos*  
8596 inhabitant; N.L. masc. n. *Scybalenecus* a microbe associated with faeces)

8597

8598 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8599 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8600 species *Scybalenecus merdavium*. This is a name for the alphanumeric GTDB genus UMGS905.  
8601 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8602 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
8603 *Acutalibacteraceae*.

8604  
8605

8606 **Description of *Candidatus Scybalocola* gen. nov.**

8607 *Candidatus Scybalocola* (Scy.bal.o.co'la. Gr. neut. n. *scybalon* dung; L. suff. *-cola* inhabitant of;  
8608 N.L. fem. n. *Scybalocola* a microbe associated with the intestines)

8609

8610 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8611 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8612 species *Scybalocola faecigallinarum*. This is a name for the alphanumeric GTDB genus  
8613 UBA7096. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8614 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
8615 *Lachnospiraceae*.

8616

8617

8618 **Description of *Candidatus Scybalomonas* gen. nov.**

8619 *Candidatus Scybalomonas* (Scy.bal.omo'nas. Gr. neut. n. *scybalon* dung; L. fem. n. *monas* a  
8620 monad; N.L. fem. n. *Scybalomonas* a microbe associated with faeces)

8621

8622 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8623 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8624 species *Scybalomonas excrementigallinarum*. This is a name for the alphanumeric GTDB genus  
8625 UMGS680. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8626 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
8627 *Lachnospiraceae*.

8628

8629

8630 **Description of *Candidatus Scybalosoma* gen. nov.**

8631 *Candidatus Scybalosoma* (Scy.bal.o.so'ma. Gr. neut. n. *scybalon* dung; Gr. neut. n. *soma* a body;  
8632 N.L. neut. n. *Scybalosoma* a microbe associated with faeces)

8633

8634 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8635 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8636 species *Scybalosoma faecavium*. This is a name for the alphanumeric GTDB genus UMGS743.  
8637 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8638 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
8639 *Christensenellaceae*.

8640

8641

8642 **Description of *Candidatus Scybalousia* gen. nov.**

8643 *Candidatus* Scybalousia (Scy.bal.ou'si.a. Gr. neut. n. *scybalon* dung; Gr. fem. n. *ousia* an  
8644 essence; N.L. fem. n. *Scybalousia* a microbe associated with faeces)

8645  
8646 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8647 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8648 species *Scybalousia intestinigallinarum*. This is a name for the alphanumeric GTDB genus  
8649 UBA7057. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8650 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-611*.

8651  
8652

8653 **Description of *Candidatus Sellimonas avistercoris* sp. nov.**

8654 *Candidatus* Sellimonas avistercoris (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung;  
8655 N.L. gen. n. *avistercoris* of bird faeces)

8656  
8657 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8658 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8659 assigned the MAG ID ChiBcec13-3606 and which is available via NCBI BioSample  
8660 SAMN15816877. This is a new name for the alphanumeric GTDB species sp002161525. The  
8661 GC content of the type genome is 46.79% and the genome length is 2.6 Mbp.

8662  
8663

8664 **Description of *Candidatus Sphingobacterium stercorigallinarum* sp. nov.**

8665 *Candidatus* Sphingobacterium stercorigallinarum (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus*  
8666 dung; L. fem. n. *gallina* hen; N.L. gen. n. *stercorigallinarum* of hen faeces)

8667  
8668 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8669 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8670 assigned the MAG ID CHK174-1108 and which is available via NCBI BioSample  
8671 SAMN15816705. The GC content of the type genome is 44.57% and the genome length is 2.9  
8672 Mbp.

8673  
8674

8675 **Description of *Candidatus Sphingobacterium stercoripullorum* sp. nov.**

8676 *Candidatus* Sphingobacterium stercoripullorum (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
8677 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

8678  
8679 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8680 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8681 assigned the MAG ID 1719 and which is available via NCBI BioSample SAMN15816733. The  
8682 GC content of the type genome is 39.36% and the genome length is 2.7 Mbp.

8683  
8684

8685 **Description of *Candidatus Sphingomonas excrementigallinarum* sp. nov.**

8686 *Candidatus* Sphingomonas excrementigallinarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n.  
8687 *excrementum* excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallinarum* of hen  
8688 excrement)

8689

8690 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8691 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8692 assigned the MAG ID 1562 and which is available via NCBI BioSample SAMN15816779. The  
8693 GC content of the type genome is 66.49% and the genome length is 3.7 Mbp.

8694

8695

8696 **Description of *Candidatus Spyradenecus* gen. nov.**

8697 *Candidatus* Spyradenecus (Spy.rad.en.e'cus. Gr. fem. n. *spyras* ball of dung; Gr. masc. *enoikos*  
8698 inhabitant; N.L. masc. n. *Spyradenecus* a microbe associated with the intestines)

8699

8700 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8701 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8702 species *Spyradenecus faecavium*. This is a name for the alphanumeric GTDB genus W1P29-020.  
8703 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8704 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RFP12* and to the family *W1P29-020*.

8705

8706

8707 **Description of *Candidatus Spyradenecus faecavium* sp. nov.**

8708 *Candidatus* Spyradenecus faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8709 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8710

8711 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8712 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8713 assigned the MAG ID 35461 and which is available via NCBI BioSample SAMN15817160. The  
8714 GC content of the type genome is 68.44% and the genome length is 1.8 Mbp.

8715

8716

8717 **Description of *Candidatus Spyradocola* gen. nov.**

8718 *Candidatus* Spyradocola (Spy.rad.o.co'la. Gr. fem. n. *spyras* ball of dung; L. suff. *-cola*  
8719 inhabitant of; N.L. fem. n. *Spyradocola* a microbe associated with the intestines)

8720

8721 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8722 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8723 species *Spyradocola merdaviium*. This is a name for the alphanumeric GTDB genus UBA7102.  
8724 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8725 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family  
8726 *UBA1750*.

8727

8728

8729 **Description of *Candidatus Spyradocola merdaviium* sp. nov.**

8730 *Candidatus* Spyradocola merdaviium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
8731 N.L. gen. n. *merdaviium* of bird faeces)

8732

8733 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8734 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

8735 assigned the MAG ID CHK191-18038 and which is available via NCBI BioSample  
8736 SAMN15817024. The GC content of the type genome is 66.20% and the genome length is 2.6  
8737 Mbp.

8738  
8739

8740 **Description of *Candidatus Spyradomonas* gen. nov.**

8741 *Candidatus* Spyradomonas (Spy.rad.omo'nas. Gr. fem. n. *spyras* ball of dung; L. fem. n. *monas* a  
8742 monad; N.L. fem. n. *Spyradomonas* a microbe associated with faeces)

8743

8744 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8745 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8746 species *Spyradomonas excrementavium*. This is a name for the alphanumeric GTDB genus  
8747 UMGS951. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8748 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Gastranaerophilales* and to the  
8749 family *Gastranaerophilaceae*.

8750

8751

8752 **Description of *Candidatus Spyradomonas excrementavium* sp. nov.**

8753 *Candidatus* Spyradomonas excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
8754 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

8755

8756 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8757 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8758 assigned the MAG ID CHK149-2741 and which is available via NCBI BioSample  
8759 SAMN15817232. This is a new name for the alphanumeric GTDB species sp900547155. The  
8760 GC content of the type genome is 41.54% and the genome length is 2.0 Mbp.

8761

8762

8763 **Description of *Candidatus Spyradosoma* gen. nov.**

8764 *Candidatus* Spyradosoma (Spy.rad.o.so'ma. Gr. fem. n. *spyras* ball of dung; Gr. neut. n. *soma* a  
8765 body; N.L. neut. n. *Spyradosoma* a microbe associated with faeces)

8766

8767 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8768 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8769 species *Spyradosoma merdigallarum*. This is a name for the alphanumeric GTDB genus  
8770 WOP29-029. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-  
8771 RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Opitutales* and to the family  
8772 *UBA953*.

8773

8774

8775 **Description of *Candidatus Spyradosoma merdigallarum* sp. nov.**

8776 *Candidatus* Spyradosoma merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda* faeces; L.  
8777 fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

8778

8779 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8780 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been

8781 assigned the MAG ID 10669 and which is available via NCBI BioSample SAMN15817156. The  
8782 GC content of the type genome is 62.43% and the genome length is 1.6 Mbp.

8783

8784

8785 **Description of *Candidatus Spyradousia* gen. nov.**

8786 *Candidatus* Spyradousia (Spy.rad.ou'si.a. Gr. fem. n. *spyras* ball of dung; Gr. fem. n. *ousia* an  
8787 essence; N.L. fem. n. *Spyradousia* a microbe associated with the intestines)

8788

8789 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8790 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8791 species *Spyradousia avicola*. This is a name for the alphanumeric GTDB genus UBA71. This  
8792 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
8793 al., 2019; Parks et al., 2020) to the order *Methanomassiliicoccales* and to the family  
8794 *Methanomethylophilaceae*.

8795

8796

8797 **Description of *Candidatus Spyradousia avicola* sp. nov.**

8798 *Candidatus* Spyradousia avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
8799 n. *avicola* inhabitant of birds)

8800

8801 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8802 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8803 assigned the MAG ID 6227 and which is available via NCBI BioSample SAMN15817164. The  
8804 GC content of the type genome is 60.22% and the genome length is 1.5 Mbp.

8805

8806

8807 **Description of *Candidatus Stackebrandtia excrementipullorum* sp. nov.**

8808 *Candidatus* Stackebrandtia excrementipullorum (ex.cre.men.ti.pul.lo'rum. L. neut. n.  
8809 *excrementum* excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of  
8810 young chicken excrement)

8811

8812 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8813 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8814 assigned the MAG ID ChiHjej8B7-33794 and which is available via NCBI BioSample  
8815 SAMN15816761. The GC content of the type genome is 64.17% and the genome length is 4.1  
8816 Mbp.

8817

8818

8819 **Description of *Candidatus Stackebrandtia faecavium* sp. nov.**

8820 *Candidatus* Stackebrandtia faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8821 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8822

8823 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8824 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8825 assigned the MAG ID ChiGjej4B4-770 and which is available via NCBI BioSample

8826 SAMN15816782. The GC content of the type genome is 62.84% and the genome length is 3.4  
8827 Mbp.

8828  
8829

8830 **Description of *Candidatus Stercoripulliclostridium* gen. nov.**

8831 *Candidatus* Stercoripulliclostridium (Ster.co.ri.pul.li.clos.tri'di.um. L. neut. n. *stercus* dung; N.L.  
8832 masc. n. *pullus* a young chicken; N.L. neut. n. *Clostridium* a genus name; N.L. neut. n.  
8833 *Stercoripulliclostridium* a genus related to the genus *Clostridium* but distinct from it and found in  
8834 poultry faeces)

8835

8836 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8837 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8838 species *Stercoripulliclostridium merdipullorum*. This genus has been assigned by GTDB-Tk  
8839 v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020) to the  
8840 order *Christensenellales* and to the family *DTU072*.

8841

8842

8843 **Description of *Candidatus Stercoripulliclostridium merdigallarum* sp. nov.**

8844 *Candidatus* Stercoripulliclostridium merdigallarum (mer.di.gal.li.na'rum. L. fem. n. *merda*  
8845 faeces; L. fem. n. *gallina* hen; N.L. gen. n. *merdigallarum* of hen faeces)

8846

8847 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8848 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8849 assigned the MAG ID 18911 and which is available via NCBI BioSample SAMN15816986. The  
8850 GC content of the type genome is 48.67% and the genome length is 1.5 Mbp.

8851

8852

8853 **Description of *Candidatus Stercoripulliclostridium merdipullorum* sp. nov.**

8854 *Candidatus* Stercoripulliclostridium merdipullorum (mer.di.pul.lo'rum. L. fem. n. *merda* faeces;  
8855 L. masc. n. *pullus* a young chicken; N.L. gen. n. *merdipullorum* of the faeces of young chickens)

8856

8857 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8858 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8859 assigned the MAG ID 23406 and which is available via NCBI BioSample SAMN15816995. The  
8860 GC content of the type genome is 53.33% and the genome length is 1.7 Mbp.

8861

8862

8863 **Description of *Candidatus Stercoripulliclostridium pullicola* sp. nov.**

8864 *Candidatus* Stercoripulliclostridium pullicola (pul.li'co.la. L. masc. n. *pullus* a young chicken; L.  
8865 suff. *-cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

8866

8867 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8868 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8869 assigned the MAG ID 517 and which is available via NCBI BioSample SAMN15816997. The  
8870 GC content of the type genome is 52.41% and the genome length is 1.6 Mbp.

8871

8872

**8873 Description of *Candidatus Stercorousia* gen. nov.**

8874 *Candidatus* Stercorousia (Ster.cor.ou'si.a. L. neut. n. *stercus* dung; Gr. fem. n. *ousia* an essence;  
8875 N.L. fem. n. *Stercorousia* a microbe associated with the intestines)

8876

8877 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8878 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8879 species *Stercorousia faecigallinarum*. This is a name for the alphanumeric GTDB genus Zag1.  
8880 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8881 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Gastranaerophilales* and to the family  
8882 *Gastranaerophilaceae*.

8883

8884

**8885 Description of *Candidatus Stercorousia faecigallinarum* sp. nov.**

8886 *Candidatus* Stercorousia faecigallinarum (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* excrement;  
8887 L. fem. n. *gallina* hen; N.L. gen. n. *faecigallinarum* of hen faeces)

8888

8889 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8890 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8891 assigned the MAG ID CHK154-323 and which is available via NCBI BioSample  
8892 SAMN15817192. This is a new name for the alphanumeric GTDB species sp000438175. The  
8893 GC content of the type genome is 34.85% and the genome length is 2.1 Mbp.

8894

8895

**8896 Description of *Candidatus Streptococcus faecavium* sp. nov.**

8897 *Candidatus* Streptococcus faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8898 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8899

8900 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8901 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8902 assigned the MAG ID ChiBcolR9-63 and which is available via NCBI BioSample  
8903 SAMN15816845. This is a new name for the alphanumeric GTDB species sp002300045. The  
8904 GC content of the type genome is 40.90% and the genome length is 1.4 Mbp.

8905

8906

**8907 Description of *Candidatus Sutterella merdavium* sp. nov.**

8908 *Candidatus* Sutterella merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird;  
8909 N.L. gen. n. *merdavium* of bird faeces)

8910

8911 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8912 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8913 assigned the MAG ID ChiGjej6B6-11950 and which is available via NCBI BioSample  
8914 SAMN15816882. This is a new name for the alphanumeric GTDB species sp900543805. The  
8915 GC content of the type genome is 62.35% and the genome length is 2.1 Mbp.

8916

8917

8918 **Description of *Candidatus Tetragenococcus pullicola* sp. nov.**

8919 *Candidatus Tetragenococcus pullicola* (pul.li'co.la. L. masc. n. *pullus* a young chicken; L. suff. -  
8920 *cola* inhabitant of; N.L. n. *pullicola* an inhabitant of young chickens)

8921

8922 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8923 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8924 assigned the MAG ID CHK175-10598 and which is available via NCBI BioSample  
8925 SAMN15816709. The GC content of the type genome is 36.35% and the genome length is 2.6  
8926 Mbp.

8927

8928

8929 **Description of *Candidatus Tidjanibacter faecipullorum* sp. nov.**

8930 *Candidatus Tidjanibacter faecipullorum* (fae.ci.pul.lo'rum. L. fem. n. *faex*, *faecis* excrement; L.  
8931 masc. n. *pullus* a young chicken; N.L. gen. n. *faecipullorum* of young chicken faeces)

8932

8933 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8934 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8935 assigned the MAG ID ChiHjej11B10-19426 and which is available via NCBI BioSample  
8936 SAMN15816696. The GC content of the type genome is 60.46% and the genome length is 1.8  
8937 Mbp.

8938

8939

8940 **Description of *Candidatus Tidjanibacter gallistercoris* sp. nov.**

8941 *Candidatus Tidjanibacter gallistercoris* (gal.li.ster'co.ris. L. masc. n. *gallus* chicken; L. neut. n.  
8942 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

8943

8944 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8945 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8946 assigned the MAG ID ChiSxjej4B16-7142 and which is available via NCBI BioSample  
8947 SAMN15816746. The GC content of the type genome is 58.50% and the genome length is 2.0  
8948 Mbp.

8949

8950

8951 **Description of *Candidatus Treponema excrementipullorum* sp. nov.**

8952 *Candidatus Treponema excrementipullorum* (ex.cre.men.ti.pul.lo'rum. L. neut. n. *excrementum*  
8953 excrement; L. masc. n. *pullus* a young chicken; N.L. gen. n. *excrementipullorum* of young  
8954 chicken excrement)

8955

8956 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8957 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8958 assigned the MAG ID Gambia15-2214 and which is available via NCBI BioSample  
8959 SAMN15816896. Although GTDB has assigned this species to the genus it calls *Treponema\_F*,  
8960 this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
8961 species, we have used the current validly published name for the genus. The GC content of the  
8962 type genome is 39.91% and the genome length is 2.3 Mbp.

8963

8964

**8965 Description of *Candidatus Treponema faecavium* sp. nov.**

8966 *Candidatus* Treponema faecavium (faec.a'vi.um. L. fem. n. *faex*, *faecis* excrement; L. fem. n.  
8967 *avis* bird; N.L. gen. n. *faecavium* of bird faeces)

8968

8969 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8970 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8971 assigned the MAG ID USASDec8-330 and which is available via NCBI BioSample  
8972 SAMN15816910. Although GTDB has assigned this species to the genus it calls Treponema\_F ,  
8973 this genus designation cannot be incorporated into a well-formed binomial, so in naming this  
8974 species, we have used the current validly published name for the genus. The GC content of the  
8975 type genome is 53.41% and the genome length is 2.2 Mbp.

8976

8977

**8978 Description of *Candidatus Ureaplasma intestinipullorum* sp. nov.**

8979 *Candidatus* Ureaplasma intestinipullorum (in.tes.ti.ni.pul.lo'rum. L. neut. n. *intestinum* gut; L.  
8980 masc. n. *pullus* a young chicken; N.L. gen. n. *intestinipullorum* of the gut of young chickens)

8981

8982 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
8983 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
8984 assigned the MAG ID A5-1222 and which is available via NCBI BioSample SAMN15816777.  
8985 The GC content of the type genome is 24.43% and the genome length is 0.6 Mbp.

8986

8987

**8988 Description of *Candidatus Ventrenecus* gen. nov.**

8989 *Candidatus* Ventrenecus (Ventren.e'cus. L. masc. n. *venter* the belly; Gr. masc. *enoikos*  
8990 inhabitant; N.L. masc. n. *Ventrenecus* a microbe associated with faeces)

8991

8992 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
8993 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
8994 species *Ventrenecus avicola*. This is a name for the alphanumeric GTDB genus UMGS1217.  
8995 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
8996 (Chaumeil et al., 2019; Parks et al., 2020) to the order *RF39* and to the family *CAG-1000*.

8997

8998

**8999 Description of *Candidatus Ventrenecus avicola* sp. nov.**

9000 *Candidatus* Ventrenecus avicola (a.vi'co.la. L. fem. n. *avis* bird; L. suff. *-cola* inhabitant of; N.L.  
9001 n. *avicola* inhabitant of birds)

9002

9003 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9004 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9005 assigned the MAG ID ChiW22-487 and which is available via NCBI BioSample  
9006 SAMN15817076. The GC content of the type genome is 31.09% and the genome length is 1.3  
9007 Mbp.

9008

9009

9010 **Description of *Candidatus Ventrenecus stercoripullorum* sp. nov.**

9011 *Candidatus Ventrenecus stercoripullorum* (ster.co.ri.pul.lo'rum. L. neut. n. *stercus* dung; L.  
9012 masc. n. *pullus* a young chicken; N.L. gen. n. *stercoripullorum* of the faeces of young chickens)

9013

9014 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9015 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9016 assigned the MAG ID CHK197-17881 and which is available via NCBI BioSample  
9017 SAMN15817010. The GC content of the type genome is 30.90% and the genome length is 1.4  
9018 Mbp.

9019

9020

9021 **Description of *Candidatus Ventricola* gen. nov.**

9022 *Candidatus Ventricola* (Ven.tri.co'la. L. masc. n. *venter* the belly; L. suff. *-cola* inhabitant of;  
9023 N.L. fem. n. *Ventricola* a microbe associated with faeces)

9024

9025 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
9026 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
9027 species *Ventricola intestinavium*. This is a name for the alphanumeric GTDB genus SFFH01.  
9028 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
9029 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Christensenellales* and to the family *CAG-*  
9030 *74*.

9031

9032

9033 **Description of *Candidatus Ventricola gallistercoris* sp. nov.**

9034 *Candidatus Ventricola gallistercoris* (gal.li.ster'co.ris. L. masc. n *gallus* chicken; L. neut. n.  
9035 *stercus* dung; N.L. gen. n. *gallistercoris* of chicken faeces)

9036

9037 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9038 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9039 assigned the MAG ID ChiHcec16-310 and which is available via NCBI BioSample  
9040 SAMN15817100. The GC content of the type genome is 60.63% and the genome length is 2.4  
9041 Mbp.

9042

9043

9044 **Description of *Candidatus Ventricola intestinavium* sp. nov.**

9045 *Candidatus Ventricola intestinavium* (in.tes.tin.a'vi.um. L. neut. n. *intestinum* gut; L. fem. n. *avis*  
9046 bird; N.L. gen. n. *intestinavium* of the gut of birds)

9047

9048 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9049 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9050 assigned the MAG ID 8987 and which is available via NCBI BioSample SAMN15817130. The  
9051 GC content of the type genome is 59.95% and the genome length is 2.2 Mbp.

9052

9053

9054 **Description of *Candidatus Ventrimonas* gen. nov.**

9055 *Candidatus* Ventrimonas (Ven.tri.mo'nas. L. masc. n. *venter* the belly; L. fem. n. *monas* a  
9056 monad; N.L. fem. n. *Ventrimonas* a microbe associated with faeces)

9057

9058 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
9059 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
9060 species *Ventrimonas merdavium*. This is a name for the alphanumeric GTDB genus UBA9502.  
9061 This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
9062 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family  
9063 *Lachnospiraceae*.

9064

9065

9066 **Description of *Candidatus* Ventrimonas merdavium sp. nov.**

9067 *Candidatus* Ventrimonas merdavium (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis*  
9068 bird; N.L. gen. n. *merdavium* of bird faeces)

9069

9070 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9071 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9072 assigned the MAG ID USAMLcec2-739 and which is available via NCBI BioSample  
9073 SAMN15817118. The GC content of the type genome is 57.43% and the genome length is 3.0  
9074 Mbp.

9075

9076

9077 **Description of *Candidatus* Ventrisona gen. nov.**

9078 *Candidatus* Ventrisona (Ven.tri.so'ma. L. masc. n. *venter* the belly; Gr. neut. n. *soma* a body;  
9079 N.L. neut. n. *Ventrisona* a microbe associated with faeces)

9080

9081 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
9082 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
9083 species *Ventrisona faecale*. This is a name for the alphanumeric GTDB genus UC5-1-2E3. This  
9084 genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95 (Chaumeil et  
9085 al., 2019; Parks et al., 2020) to the order *Lachnospirales* and to the family *Lachnospiraceae*.

9086

9087

9088 **Description of *Candidatus* Ventrisona faecale sp. nov.**

9089 *Candidatus* Ventrisona faecale (fae.ca'le. L. neut. adj. *faecale* of faeces)

9090

9091 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9092 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9093 assigned the MAG ID ChiHcolR19-5415 and which is available via NCBI BioSample  
9094 SAMN15817173. This is a new name for the alphanumeric GTDB species sp001304875. The  
9095 GC content of the type genome is 55.91% and the genome length is 2.8 Mbp.

9096

9097

9098 **Description of *Candidatus* Ventrousia gen. nov.**

9099 *Candidatus* Ventrousia (Ventr.ou'si.a. L. masc. n. *venter* the belly; Gr. fem. n. *ousia* an essence;  
9100 N.L. fem. n. *Ventrousia* a microbe associated with faeces)

9101

9102 A bacterial genus identified by metagenomic analyses. The genus includes all bacteria with  
9103 genomes that show  $\geq 60\%$  average amino acid identity (AAI) to the type genome from the type  
9104 species *Ventrousia excrementavium*. This is a name for the alphanumeric GTDB genus SCN-57-  
9105 10. This genus has been assigned by GTDB-Tk v1.3.0 working on GTDB Release 05-RS95  
9106 (Chaumeil et al., 2019; Parks et al., 2020) to the order *Oscillospirales* and to the family  
9107 *Butyricicoccaceae*.

9108

9109

9110 **Description of *Candidatus Ventrousia excrementavium* sp. nov.**

9111 *Candidatus* Ventrousia excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum*  
9112 excrement; L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

9113

9114 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9115 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9116 assigned the MAG ID CHK191-8634 and which is available via NCBI BioSample  
9117 SAMN15817048. The GC content of the type genome is 57.61% and the genome length is 2.1  
9118 Mbp.

9119

9120

9121 **Description of *Candidatus Yaniella excrementavium* sp. nov.**

9122 *Candidatus* Yaniella excrementavium (ex.cre.ment.a'vi.um. L. neut. n. *excrementum* excrement;  
9123 L. fem. n. *avis* bird; N.L. gen. n. *excrementavium* of bird excrement)

9124

9125 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9126 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9127 assigned the MAG ID ChiHjej13B12-778 and which is available via NCBI BioSample  
9128 SAMN15816702. The GC content of the type genome is 55.30% and the genome length is 2.5  
9129 Mbp.

9130

9131

9132 **Description of *Candidatus Yaniella excrementigallarum* sp. nov.**

9133 *Candidatus* Yaniella excrementigallarum (ex.cre.men.ti.gal.li.na'rum. L. neut. n. *excrementum*  
9134 excrement; L. fem. n. *gallina* hen; N.L. gen. n. *excrementigallarum* of hen excrement)

9135

9136 A bacterial species identified by metagenomic analyses. This species includes all bacteria with  
9137 genomes that show  $\geq 95\%$  average nucleotide identity (ANI) to the type genome, which has been  
9138 assigned the MAG ID 4905 and which is available via NCBI BioSample SAMN15816764. The  
9139 GC content of the type genome is 53.17% and the genome length is 2.6 Mbp.

9140

**Table 2** (on next page)

Protologues for new taxa cultured from chicken faeces

1 **Description of *Acinetobacter pecorum* sp. nov.**

2 (pe.co'rum M.L. gen. pl. *pecorum* of flocks of sheep, birds etc., as this species has been isolated  
3 from chickens and sheep)

4

5 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
6 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
7 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
8 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
9 species within this genus has been confirmed by phylogenetic analysis of all available reference  
10 genomes from the genus (Figure S3).

11

12 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
13 (ANI) to the genome of the type strain, which is available via GenBank accession  
14 GCA\_014837015.1. The GC content of the type strain is 42.9% and the genome size is 3.2 Mbp.  
15 GTDB has given this species the alphanumerical designation sp001647535 and the two other  
16 genomes assigned to this species are derived from sheep isolates (RefSeq assembly accessions  
17 GCF\_001647535.1, GCF\_001647575.1) (Gupta et al., 2016). The type strain has been deposited  
18 in NCTC and DSMZ, where it can be identified via the original strain reference Sa1BUA6.

19

20 **Description of *Arthrobacter gallicola* sp. nov.**

21 (gal.li'co.la. L. masc. n. *gallus* a cock; N.L. suff. *-cola* an inhabitant of; N.L. masc. or fem. n.  
22 *gallicola* an inhabitant of the chicken)

23

24 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
25 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
26 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
27 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
28 species within this genus has been confirmed by phylogenetic analysis of all available reference  
29 genomes from the genus (Figure S3).

30

31 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
32 (ANI) to the genome of the type strain, which is available via GenBank accession  
33 GCA\_014836775.1. The GC content of the type strain is 65.5% and the genome size is 3.7 Mbp.  
34 Although GTDB has assigned this species to the genus it calls *Arthrobacter\_B*, this genus  
35 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
36 have used the basonym for the genus. The type strain has been deposited in NCTC and DSMZ,  
37 where it can be identified via the original strain reference Sa2CUA1.

38

39 **Description of *Arthrobacter pullicola* sp. nov.**

40 (pul.li'co.la. L. masc. n. *pullus* a young chicken; N.L. suff. *-cola* an inhabitant of; N.L. masc. or  
41 fem. n. *pullicola* an inhabitant of young chickens)

42

43 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
44 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
45 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
46 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a

47 species within this genus has been confirmed by phylogenetic analysis of all available reference  
48 genomes from the genus (Figure S3).

49

50 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
51 (ANI) to the genome of the type strain, which is available via GenBank accession  
52 GCA\_014836875.1. The GC content of the type strain is 65.7% and the genome size is 3.7 Mbp.  
53 Although GTDB has assigned this species to the genus it calls *Arthrobacter\_B*, this genus  
54 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
55 have used the basonym for the genus. The type strain has been deposited in NCTC and DSMZ,  
56 where it can be identified via the original strain reference Sa2BUA2.

57

### 58 **Description of *Bacillus norwichensis* sp. nov.**

59 (nor.wich.en'sis. N.L. masc. adj. *norwichensis* pertaining to English city of Norwich, where the  
60 organism was isolated)

61

62 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
63 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
64 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
65 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
66 species within this genus has been confirmed by phylogenetic analysis of all available reference  
67 genomes from the genus (Figure S3).

68

69 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
70 (ANI) to the genome of the type strain, which is available via GenBank accession  
71 GCA\_014836955.1. The GC content of the type strain is 40.2% and the genome size is 4.7 Mbp.  
72 Although GTDB has assigned this species to the genus it calls *Bacillus\_AM*, this genus  
73 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
74 have used the basonym for the genus. The type strain has been deposited in NCTC and DSMZ,  
75 where it can be identified via the original strain reference Sa1BUA2

76

### 77 **Description of *Brevibacterium gallinarum* sp. nov.**

78 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

79

80 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
81 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
82 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
83 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
84 species within this genus has been confirmed by phylogenetic analysis of all available reference  
85 genomes from the genus (Figure S3).

86

87 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
88 (ANI) to the genome of the type strain, which is available via GenBank accession  
89 GCA\_014836885.1. The GC content of the type strain is 67.0% and the genome size is 3.2 Mbp.  
90 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
91 original strain reference Re57

92

93 **Description of *Brevundimonas guildfordensis* sp. nov.**

94 (guild.ford.en'sis. N.L. fem. adj. *guildfordensis* pertaining to English town Guildford, home to  
95 the University of Surrey, where the samples were processed)

96

97 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
98 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
99 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
100 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
101 species within this genus has been confirmed by phylogenetic analysis of all available reference  
102 genomes from the genus (Figure S3).

103

104 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
105 (ANI) to the genome of the type strain, which is available via GenBank accession  
106 GCA\_014836405.1. The GC content of the type strain is 67.3% and the genome size is 2.9 Mbp.  
107 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
108 original strain reference Sa3CVA3

109

110 **Description of *Cellulomonas avistercoris* sp. nov.**

111 (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung; N.L. gen. n. *avistercoris* of bird  
112 faeces)

113

114 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
115 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
116 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
117 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
118 species within this genus has been confirmed by phylogenetic analysis of all available reference  
119 genomes from the genus (Figure S3).

120

121 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
122 (ANI) to the genome of the type strain, which is available via GenBank accession  
123 GCA\_014836445.1. The GC content of the type strain is 74.5% and the genome size is 4.2 Mbp.  
124 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
125 original strain reference Sa3CUA2

126

127 **Description of *Clostridium cibarium* sp. nov.**

128 (ci.ba'ri.um. L. neut. adj. *cibarium* pertaining to food, as this species has been isolated from  
129 chickens and zha-chili)

130

131 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
132 incubation on Columbia blood agar at 37°C under anaerobic conditions. The species has been  
133 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
134 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
135 species within this genus has been confirmed by phylogenetic analysis of all available reference  
136 genomes from the genus (Figure S3).

137

138 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
139 (ANI) to the genome of the type strain, which is available via GenBank accession  
140 GCA\_014836335.1. The GC content of the type strain is 29.8% and the genome size is 4.3 Mbp.  
141 GTDB has given this species the alphanumerical designation sp007115085. One other isolate  
142 from this species (RefSeq accession GCA\_007115085.1) has been cultured from zha-chili, a  
143 Chinese fermented food. The type strain has been deposited in NCTC and DSMZ, where it can  
144 be identified via the original strain reference Sa3CVN1.

145

#### 146 **Description of *Clostridium gallinarum* sp. nov.**

147 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

148

149 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
150 incubation on Columbia blood agar at 37°C under anaerobic conditions. The species has been  
151 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
152 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
153 species within this genus has been confirmed by phylogenetic analysis of all available reference  
154 genomes from the genus (Figure S3).

155

156 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
157 (ANI) to the genome of the type strain, which is available via GenBank accession  
158 GCA\_014836325.1. The GC content of the type strain is 27.2% and the genome size is 3.4 Mbp.  
159 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
160 original strain reference Sa3CUN1.

161

#### 162 **Description of *Clostridium faecium* sp. nov.**

163 (fae'ci.um N.L. gen. pl. n. *faecium*, of faeces, as this species has been isolated from chicken and  
164 human faeces)

165

166 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
167 incubation on brain-heart infusion agar at 37°C under anaerobic conditions. The species has been  
168 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
169 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
170 species within this genus has been confirmed by phylogenetic analysis of all available reference  
171 genomes from the genus (Figure S3).

172

173 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
174 (ANI) to the genome of the type strain, which is available via GenBank accession  
175 GCA\_014836835.1. The GC content of the type strain is 28.7% and the genome size is 3.9 Mbp.  
176 Although GTDB has assigned this species to the genus it calls *Clostridium\_J*, this genus  
177 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
178 have used the basonym for the genus. GTDB has given this species the alphanumerical  
179 designation sp900547625, which includes a gut isolate from a preterm human infant (GenBank  
180 accession GCA\_900547625.1). The type strain has been deposited in NCTC and DSMZ, where it  
181 can be identified via the original strain reference N37

182

**183 Description of *Comamonas avium* sp. nov.**

184 (a'vi.um. L. gen. pl. n. *avium* of birds)

185

186 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
187 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
188 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
189 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
190 species within this genus has been confirmed by phylogenetic analysis of all available reference  
191 genomes from the genus (Figure S3).

192

193 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
194 (ANI) to the genome of the type strain, which is available via GenBank accession  
195 GCA\_014836675.1. The GC content of the type strain is 57.5% and the genome size is 3.9 Mbp.  
196 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
197 original strain reference Sa2CVA6

198

**199 Description of *Corynebacterium gallinarum* sp. nov.**

200 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

201

202 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
203 incubation on YCFA (yeast extract, casitone and fatty acid) agar at 37°C under aerobic  
204 conditions. The species has been assigned to this genus by the software tool GTDB-Tk v1.3.0  
205 applied to the Genome Taxonomy Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019;  
206 Parks et al., 2020). Its status as a species within this genus has been confirmed by phylogenetic  
207 analysis of all available reference genomes from the genus (Figure S3).

208

209 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
210 (ANI) to the genome of the type strain, which is available via GenBank accession  
211 GCA\_014837045.1. The GC content of the type strain is 63.1% and the genome size is 3.1 Mbp.  
212 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
213 original strain reference Sa1YVA5

214

**215 Description of *Cytobacillus stercorigallinarum* sp. nov.**

216 (ster.co.ri.gal.li.na'rum. L. neut. n. *stercus* faeces; L. fem. n. *gallina* a hen; N.L. gen. n.

217 *stercorigallinarum* of hen faeces)

218

219 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
220 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
221 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
222 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
223 species within this genus has been confirmed by phylogenetic analysis of all available reference  
224 genomes from the genus (Figure S3).

225

226 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
227 (ANI) to the genome of the type strain, which is available via GenBank accession  
228 GCA\_014836495.1. The GC content of the type strain is 36.8% and the genome size is 4.4 Mbp.

229 GTDB has assigned this species to the genus it calls *Bacillus\_AA*, which cannot be incorporated  
230 into a well-formed binomial. However, according to (Patel & Gupta, 2020), the newly named  
231 genus *Cytobacillus* encompasses other species classified by GTDB within the genus designation  
232 *Bacillus\_AA* and therefore *Cytobacillus* is treated as a synonym of GTDB *Bacillus\_AA*. The type  
233 strain has been deposited in NCTC and DSMZ, where it can be identified via the original strain  
234 reference Sa5YUA1.

235

### 236 **Description of *Escherichia whittamii* sp. nov.**

237 (whitt.am'i.i. N.L. gen. n. *whittamii*, named in honour of American microbiologist Thomas S.  
238 Whittam)

239

240 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
241 incubation on Columbia blood agar at 37°C under anaerobic conditions. The species has been  
242 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
243 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
244 species within this genus has been confirmed by phylogenetic analysis of reference genomes  
245 from the genus (Figure 4).

246

247 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
248 (ANI) to the genome of the type strain, which is available via GenBank accession  
249 GCA\_014836715.1. The GC content of the type strain is 50.6% and the genome size is 4.6 Mbp.  
250 GTDB has given this species the alphanumeric designation sp001660175 and has assigned two  
251 other cultured isolates to this species, both of which come from birds (RefSeq assembly  
252 accessions GCF\_001660175.1, GCF\_002965485.1) (Clermont et al., 2011; Gangiredla et al.,  
253 2018) The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
254 original strain reference Sa2BVA5.

255

### 256 **Description of *Fictibacillus norfolkensis* sp. nov.**

257 (nor.folk.en\_sis. N.L. masc. adj. *norfolkensis* pertaining to the English county of Norfolk)

258

259 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
260 incubation on YCFA (yeast extract, casitone and fatty acid) agar at 37°C under aerobic  
261 conditions. The species has been assigned to this genus by the software tool GTDB-Tk v1.3.0  
262 applied to the Genome Taxonomy Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019;  
263 Parks et al., 2020). Its status as a species within this genus has been confirmed by phylogenetic  
264 analysis of all available reference genomes from the genus (Figure S3).

265

266 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
267 (ANI) to the genome of the type strain, which is available via GenBank accession  
268 GCA\_014836645.1. The GC content of the type strain is 39.5% and the genome size is 4.0 Mbp.  
269 Although GTDB has assigned this species to the genus it calls *Fictibacillus\_B*, this genus  
270 designation cannot be incorporated into a well-formed binomial, so in naming this species, we  
271 have used the basonym for the genus. The type strain has been deposited in NCTC and DSMZ,  
272 where it can be identified via the original strain reference Sa2CUA10

273

**274 Description of *Kaistella pullorum* sp. nov.**

275 (pul.lor\_um. L. gen. pl. n. *pullorum* of chickens)

276

277 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
278 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
279 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
280 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
281 species within this genus has been confirmed by phylogenetic analysis of all available reference  
282 genomes from the genus (Figure S3).

283

284 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
285 (ANI) to the genome of the type strain, which is available via GenBank accession  
286 GCA\_014837035.1. The GC content of the type strain is 42.9% and the genome size is 2.6 Mbp.  
287 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
288 original strain reference Sa1CVA4

289

**290 Description of *Limosilactobacillus avistercoris* sp. nov.**

291 (a.vi.ster'co.ris. L. fem. n. *avis* bird; L. neut. n. *stercus* dung; N.L. gen. n. *avistercoris* of bird  
292 faeces)

293

294 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
295 incubation on brain-heart infusion agar at 37°C under anaerobic conditions. The species has been  
296 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
297 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
298 species within this genus has been confirmed by phylogenetic analysis of all available reference  
299 genomes from the genus (Figure S3).

300

301 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
302 (ANI) to the genome of the type strain, which is available via GenBank accession  
303 GCA\_014836425.1. The GC content of the type strain is 39.9% and the genome size is 1.8 Mbp.  
304 GTDB has assigned this species to the genus it calls *Lactobacillus\_H*, which cannot be  
305 incorporated into a well-formed binomial. However, according to (Zheng et al., 2020)  
306 *Limosilactobacillus* encompasses other species classified by GTDB within the genus designation  
307 *Lactobacillus\_H* and therefore *Limosilactobacillus* is treated as a synonym for GDTB  
308 designation *Lactobacillus\_H*. The type strain has been deposited in NCTC and DSMZ, where it  
309 can be identified via the original strain reference Sa3CUN2

310

**311 Description of *Luteimonas colneyensis* sp. nov.**

312 (col.ney.en'sis. N.L. fem. adj. *colneyensis* pertaining to the English village of Colney, home to  
313 the Quadram Institute, where the species was first described)

314

315 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
316 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
317 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
318 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a

319 species within this genus has been confirmed by phylogenetic analysis of all available reference  
320 genomes from the genus (Figure S3).

321

322 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
323 (ANI) to the genome of the type strain, which is available via GenBank accession  
324 GCA\_014836665.1. The GC content of the type strain is 71.0% and the genome size is 3.0 Mbp.  
325 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
326 original strain reference Sa2BVA3

327

### 328 **Description of *Microbacterium commune* sp. nov.**

329 (com.mu\_ne. L. neut. adj. *commune* common, referring to diverse habitats, as this species has  
330 been isolated from mosquitos and chicken)

331

332 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
333 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
334 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
335 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
336 species within this genus has been confirmed by phylogenetic analysis of all available reference  
337 genomes from the genus (Figure S3).

338

339 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
340 (ANI) to the genome of the type strain, which is available via GenBank accession  
341 GCA\_014836945.1. The GC content of the type strain is 70.3% and the genome size is 3.3 Mbp.  
342 GTDB has given this species the alphanumerical designation sp001878835, which also contains  
343 a mosquito isolate (RefSeq accession GCF\_001878835.1). The type strain has been deposited in  
344 NCTC and DSMZ, where it can be identified via the original strain reference Re1.

345

### 346 **Description of *Microbacterium gallinarum* sp. nov.**

347 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

348

349 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
350 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
351 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
352 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
353 species within this genus has been confirmed by phylogenetic analysis of all available reference  
354 genomes from the genus (Figure S3).

355

356 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
357 (ANI) to the genome of the type strain, which is available via GenBank accession  
358 GCA\_014837165.1. The GC content of the type strain is 69.4% and the genome size is 2.8 Mbp.  
359 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
360 original strain reference Sa1CUA4

361

### 362 **Description of *Microbacterium pullorum* sp. nov.**

363 (pul.lor\_um. L. gen. pl. n. *pullorum* of chickens)

364

365 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
366 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
367 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
368 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
369 species within this genus has been confirmed by phylogenetic analysis of all available reference  
370 genomes from the genus (Figure S3).

371

372 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
373 (ANI) to the genome of the type strain, which is available via GenBank accession  
374 GCA\_014836535.1. The GC content of the type strain is 70.1% and the genome size is 3.1 Mbp.  
375 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
376 original strain reference Sa4CUA7

377

### 378 **Description of *Oceanitalea stevensii* sp. nov.**

379 (ste.ven'si.i. N.L. gen. n. *stevensii*, named in honour of British microbiologist Mark Stevens)

380

381 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
382 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
383 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
384 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
385 species within this genus has been confirmed by phylogenetic analysis of all available reference  
386 genomes from the genus (Figure S3).

387

388 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
389 (ANI) to the genome of the type strain, which is available via GenBank accession  
390 GCA\_014837105.1. The GC content of the type strain is 73.4% and the genome size is 3.5 Mbp.  
391 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
392 original strain reference Sa1BUA1.

393

### 394 **Description of *Ochrobactrum gallinarum* sp. nov.**

395 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

396

397 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
398 incubation on brain-heart infusion at 37°C under aerobic conditions. The species has been  
399 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
400 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
401 species within this genus has been confirmed by phylogenetic analysis of all available reference  
402 genomes from the genus (Figure S3).

403

404 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
405 (ANI) to the genome of the type strain, which is available via GenBank accession  
406 GCA\_014836735.1. The GC content of the type strain is 53.5% and the genome size is 5.0 Mbp.  
407 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
408 original strain reference Sa2BUA5

409

**410 Description of *Oerskovia douganii* sp. nov.**

411 (dou.gan\_i.i. N.L. gen. n. *douganii* named in honour of British microbiologist Gordon Dougan)

412

413 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
414 incubation on brain-heart infusion at 37°C under aerobic conditions. The species has been  
415 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
416 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
417 species within this genus has been confirmed by phylogenetic analysis of all available reference  
418 genomes from the genus (Figure S3).

419

420 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
421 (ANI) to the genome of the type strain, which is available via GenBank accession  
422 GCA\_015142735.1. The GC content of the type strain is 72.5% and the genome size is 4.3 Mbp.  
423 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
424 original strain reference Sa1BUA8

425

**426 Description of *Oerskovia gallyi* sp. nov.**

427 (gall.y'i. N.L. gen. n. *gallyi* named in honour of British microbiologist David Gally)

428

429 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
430 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
431 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
432 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
433 species within this genus has been confirmed by phylogenetic analysis of all available reference  
434 genomes from the genus (Figure S3).

435

436 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
437 (ANI) to the genome of the type strain, which is available via GenBank accession  
438 GCA\_014836745.1. The GC content of the type strain is 72.5% and the genome size is 4.3 Mbp.  
439 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
440 original strain reference Sa2CUA8

441

**442 Description of *Oerskovia merdavium* sp. nov.**

443 (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird; N.L. gen. n. *merdavium* of bird  
444 faeces)

445

446 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
447 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
448 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
449 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
450 species within this genus has been confirmed by phylogenetic analysis of all available reference  
451 genomes from the genus (Figure S3).

452

453 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
454 (ANI) to the genome of the type strain, which is available via GenBank accession  
455 GCA\_014836755.1. The GC content of the type strain is 72.1% and the genome size is 4.5 Mbp.

456 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
457 original strain reference Sa2CUA9.

458

459 **Description of *Oerskovia rustica* sp. nov.**

460 (rus'tic.a L fem adj. *rustica* of the countryside, as isolates have been obtained from soil and  
461 chickens)

462

463 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
464 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
465 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
466 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
467 species within this genus has been confirmed by phylogenetic analysis of all available reference  
468 genomes from the genus (Figure S3).

469

470 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
471 (ANI) to the genome of the type strain, which is available via GenBank accession  
472 GCA\_014836555.1. The GC content of the type strain is 72.5% and the genome size is 4.4 Mbp.  
473 GTDB has given this species the alphanumerical designation sp005937995, which includes a soil  
474 isolate (RefSeq accession GCF\_005937995.2). The type strain has been deposited in NCTC and  
475 DSMZ, where it can be identified via the original strain reference Sa4CUA1.

476

477 **Description of *Paenibacillus gallinarum* sp. nov.**

478 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

479

480 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
481 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been  
482 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
483 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
484 species within this genus has been confirmed by phylogenetic analysis of all available reference  
485 genomes from the genus (Figure S3).

486

487 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
488 (ANI) to the genome of the type strain, which is available via GenBank accession  
489 GCA\_014836635.1. The GC content of the type strain is 41.2% and the genome size is 5.4 Mbp.  
490 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
491 original strain reference Sa2BVA9

492

493 **Description of *Phocaeicola faecium* sp. nov.**

494 (fae'ci.um N.L. gen. pl. n. *faecium*, of faeces)

495

496 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
497 incubation on YCFA (yeast extract, casitone and fatty acid) agar at 37°C under anaerobic  
498 conditions. The species has been assigned to this genus by the software tool GTDB-Tk v1.3.0  
499 applied to the Genome Taxonomy Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019);

500 Parks et al., 2020). Its status as a species within this genus has been confirmed by phylogenetic  
501 analysis of all available reference genomes from the genus (Figure S3).

502

503 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
504 (ANI) to the genome of the type strain, which is available via GenBank accession  
505 GCA\_014837055.1. The GC content of the type strain is 45.6% and the genome size is 3.5 Mbp.  
506 GTDB has given this species the alphanumerical designation sp900540105, which includes a gut  
507 isolate from an infant human (GenBank accession GCA\_900540105.1). The type strain has been  
508 deposited in NCTC and DSMZ, where it can be identified via the original strain reference  
509 Sa1YUN3

510

### 511 **Description of *Phocaeicola intestinalis* sp. nov.**

512 (in.tes.ti.na'lis. N.L. masc./fem. adj. *intestinalis*, pertaining to the intestines)

513

514 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
515 incubation on Columbia blood agar at 37°C under anaerobic conditions. The species has been  
516 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
517 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
518 species within this genus has been confirmed by phylogenetic analysis of all available reference  
519 genomes from the genus (Figure S3).

520

521 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
522 (ANI) to the genome of the type strain, which is available via GenBank accession  
523 GCA\_014837065.1. The GC content of the type strain is 45.7% and the genome size is 4.1 Mbp.  
524 GTDB has given this species the alphanumerical designation sp002161565, which includes  
525 isolates from the human and chicken guts (GenBank accession numbers GCA\_000432695.1,  
526 GCA\_900540165.1, GCF\_002159615.1, GCF\_002159755.1, GCF\_002160215.1,  
527 GCF\_002161565.1). The type strain has been deposited in NCTC and DSMZ, where it can be  
528 identified via the original strain reference Sa1CVN1.

529

### 530 **Description of *Planococcus wigleyi* sp. nov.**

531 (wig\_ley.i. N.L. masc. gen. n. *wigleyi* named in honour of British microbiologist Paul Wigley)

532

533 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
534 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
535 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
536 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
537 species within this genus has been confirmed by phylogenetic analysis of all available reference  
538 genomes from the genus (Figure S3).

539

540 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
541 (ANI) to the genome of the type strain, which is available via GenBank accession  
542 GCA\_014836985.1. The GC content of the type strain is 45.0% and the genome size is 3.8 Mbp.  
543 Although GTDB has assigned a genus name with an alphabetic suffix *Planococcus\_A*, this genus  
544 designation cannot be incorporated into a well-formed binomial, so in naming this species, we

545 have used the basonym for the genus. The type strain has been deposited in NCTC and DSMZ,  
546 where it can be identified via the original strain reference Sa1BUA13

547

548 **Description of *Psychrobacillus faecigallinarum* sp. nov.**

549 (fae.ci.gal.li.na'rum. L. fem. n. *faex*, *faecis* faeces; L. fem. n. *gallina* a hen; N.L. gen. n.

550 *faecigallinarum* of hen faeces)

551

552 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
553 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
554 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
555 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
556 species within this genus has been confirmed by phylogenetic analysis of all available reference  
557 genomes from the genus (Figure S3).

558

559 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
560 (ANI) to the genome of the type strain, which is available via GenBank accession  
561 GCA\_014836595.1. The GC content of the type strain is 36.5% and the genome size is 4.0 Mbp.  
562 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
563 original strain reference Sa2BUA9

564

565 **Description of *Psychrobacter communis* sp. nov.**

566 (com.mun\_is L. masc. adj. *communis* common, referring to diverse habitats from which this  
567 species has been isolated, including chickens and soil)

568

569 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
570 incubation on xyz medium at 37°C under aerobic conditions. The species has been assigned to  
571 this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy Database  
572 (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a species  
573 within this genus has been confirmed by phylogenetic analysis of all available reference  
574 genomes from the genus (Figure S3).

575

576 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
577 (ANI) to the genome of the type strain, which is available via GenBank accession  
578 GCA\_014836505.1. The GC content of the type strain is 43.7% and the genome size is 3.0 Mbp.  
579 GTDB has given this species the alphanumerical designation sp001652315, which contains six  
580 environmental isolates from a variety of sources including soil (GCA\_002332465.1,  
581 GCA\_002439405.1, GCA\_003524605.1, GCA\_007280595.1, GCF\_001652315.1,  
582 GCF\_002836335.1.) The type strain has been deposited in NCTC and DSMZ, where it can be  
583 identified via the original strain reference Sa4CVA2

584

585 **Description of *Serpens gallinarum* sp. nov.**

586 (gal.li.na'rum. L. pl. gen. n. *gallinarum* of hens)

587

588 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
589 incubation on Columbia blood agar at 37°C under aerobic conditions. The species has been

590 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
591 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
592 species within this genus has been confirmed by phylogenetic analysis of all available reference  
593 genomes from the genus (Figure S3).

594

595 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
596 (ANI) to the genome of the type strain, which is available via GenBank accession  
597 GCA\_014836765.1. The GC content of the type strain is 61.0% and the genome size is 3.9 Mbp.  
598 Although GTDB has assigned a genus name with an alphabetic suffix *Pseudomonas\_H*, which  
599 cannot be incorporated into a well-formed binomial. However, GDTB genus *Pseudomonas\_H*  
600 includes *Pseudomonas flexibilis*, where the basonym is *Serpens* (Hespell, 1977), so we have used  
601 this genus name. The type strain has been deposited in NCTC and DSMZ, where it can be  
602 identified via the original strain reference Sa2CUA2

603

#### 604 **Description of *Solibacillus faecavium* sp. nov.**

605 (faec.a'vi.um. L. fem. n. *faex*, *faecis* faeces; L. fem. n. *avis* bird; N.L. gen. n. *faecavium* of bird  
606 faeces)

607

608 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
609 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
610 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
611 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
612 species within this genus has been confirmed by phylogenetic analysis of all available reference  
613 genomes from the genus (Figure S3).

614

615 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
616 (ANI) to the genome of the type strain, which is available via GenBank accession  
617 GCA\_014836905.1. The GC content of the type strain is 37.1% and the genome size is 3.8 Mbp.  
618 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
619 original strain reference A46

620

#### 621 **Description of *Solibacillus merdavium* sp. nov.**

622 (merd.a'vi.um. L. fem. n. *merda* faeces; L. fem. n. *avis* bird; N.L. gen. n. *merdavium* of bird  
623 faeces)

624

625 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
626 incubation on YCFA (yeast extract, casitone and fatty acid) agar at 37°C under aerobic  
627 conditions. The species has been assigned to this genus by the software tool GTDB-Tk v1.3.0  
628 applied to the Genome Taxonomy Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019;  
629 Parks et al., 2020). Its status as a species within this genus has been confirmed by phylogenetic  
630 analysis of all available reference genomes from the genus (Figure S3).

631

632 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
633 (ANI) to the genome of the type strain, which is available via GenBank accession  
634 GCA\_014836935.1. The GC content of the type strain is 37.0% and the genome size is 3.8 Mbp.

635 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
636 original strain reference Sa1YVA6

637

638 **Description of *Sporosarcina gallistercoris* sp. nov.**

639 (gal.li.ster'co.ris. L. masc. n. *gallus* a cock; L. neut. n. *stercus* dung; N.L. gen. n. *gallistercoris* of  
640 faeces of a cock)

641

642 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
643 incubation on YCFA (yeast extract, casitone and fatty acid) agar at 37°C under aerobic  
644 conditions. The species has been assigned to this genus by the software tool GTDB-Tk v1.3.0  
645 applied to the Genome Taxonomy Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019;  
646 Parks et al., 2020). Its status as a species within this genus has been confirmed by phylogenetic  
647 analysis of all available reference genomes from the genus (Figure S3).

648

649 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
650 (ANI) to the genome of the type strain, which is available via GenBank accession  
651 GCA\_014836415.1. The GC content of the type strain is 44.1% and the genome size is 3.1 Mbp.  
652 Although GTDB has assigned a genus name with an alphabetic suffix *Sporosarcina\_A*, this  
653 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
654 we have used the basonym for the genus. The type strain has been deposited in NCTC and  
655 DSMZ, where it can be identified via the original strain reference Sa3CUA8

656

657 **Description of *Sporosarcina quadrami* sp. nov.**

658 (qua.dra'mi. N.L. gen. n. *quadrami*, of the Quadram Institute, where the species was first  
659 cultured.)

660

661 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
662 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
663 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
664 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
665 species within this genus has been confirmed by phylogenetic analysis of all available reference  
666 genomes from the genus (Figure S3).

667

668 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
669 (ANI) to the genome of the type strain, which is available via GenBank accession  
670 GCA\_014836615.1. The GC content of the type strain is 41.4% and the genome size is 3.6 Mbp.  
671 Although GTDB has assigned a genus name with an alphabetic suffix *Sporosarcina\_B*, this  
672 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
673 we have used the basonym for the genus. The type strain has been deposited in NCTC and  
674 DSMZ, where it can be identified via the original strain reference Sa2YVA2

675

676 **Description of *Stenotrophomonas pennii* sp. nov.**

677 (pen'ni.i. N.L. gen. n. *pennii*, named in honour of British microbiologist Charles W. Penn)

678

679 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
680 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
681 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
682 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
683 species within this genus has been confirmed by phylogenetic analysis of all available reference  
684 genomes from the genus (Figure S3).

685

686 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
687 (ANI) to the genome of the type strain, which is available via GenBank accession  
688 GCA\_014836545.1. The GC content of the type strain is 66.4% and the genome size is 3.9 Mbp.  
689 GTDB has given this species the alphanumerical designation sp002836635, which includes four  
690 environmental isolates (RefSeq accessions GCF\_000834105.1, GCF\_002836635.1,  
691 GCF\_002836645.1, GCF\_002836675.1). The type strain has been deposited in NCTC and  
692 DSMZ, where it can be identified via the original strain reference Sa5BUN4

693

#### 694 **Description of *Ureibacillus galli* sp. nov.**

695 (gal\_li. L. masc. gen. n. *galli* of a chicken)

696

697 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
698 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
699 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
700 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
701 species within this genus has been confirmed by phylogenetic analysis of all available reference  
702 genomes from the genus (Figure S3).

703

704 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
705 (ANI) to the genome of the type strain, which is available via GenBank accession  
706 GCA\_014836845.1. The GC content of the type strain is 35.2% and the genome size is 3.7 Mbp.  
707 The type strain has been deposited in NCTC and DSMZ, where it can be identified via the  
708 original strain reference Re31.

709

#### 710 **Description of *Xanthomonas surreyensis* sp. nov.**

711 (sur.rey.en'sis. N.L. fem. adj. *surreyensis* pertaining to the English county of Surrey, where the  
712 samples were obtained)

713

714 The type strain for this bacterial species has been cultured from chicken faeces after overnight  
715 incubation on brain-heart infusion agar at 37°C under aerobic conditions. The species has been  
716 assigned to this genus by the software tool GTDB-Tk v1.3.0 applied to the Genome Taxonomy  
717 Database (GTDB) Release 05-RS95 (Chaumeil et al., 2019; Parks et al., 2020). Its status as a  
718 species within this genus has been confirmed by phylogenetic analysis of all available reference  
719 genomes from the genus (Figure S3).

720

721 The species includes all bacteria with genomes that show  $\geq 95\%$  average nucleotide identity  
722 (ANI) to the genome of the type strain, which is available via GenBank accession  
723 GCA\_014836395.1. The GC content of the type strain is 68.8% and the genome size is 5.4 Mbp.  
724 Although GTDB has assigned a genus name with an alphabetic suffix *Xanthomonas\_A*, this

725 genus designation cannot be incorporated into a well-formed binomial, so in naming this species,  
726 we have used the basonym for the genus. The type strain has been deposited in NCTC and  
727 DSMZ, where it can be identified via the original strain reference Sa3BUA13.

728

# Figure 1

## Analytical Workflow

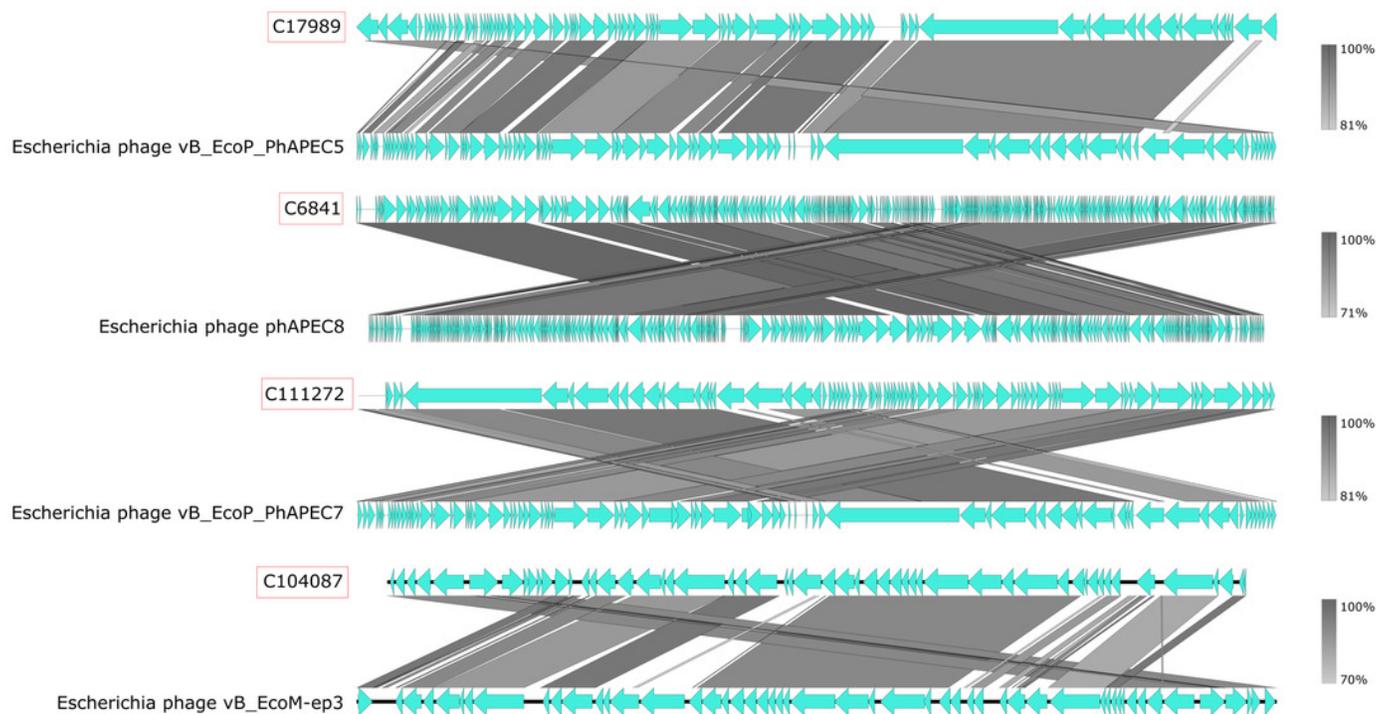

\* indicates read numbers are detailed post-filtering of diet and host associated reads.

## Figure 2

### Genome synteny of recovered phage genomes

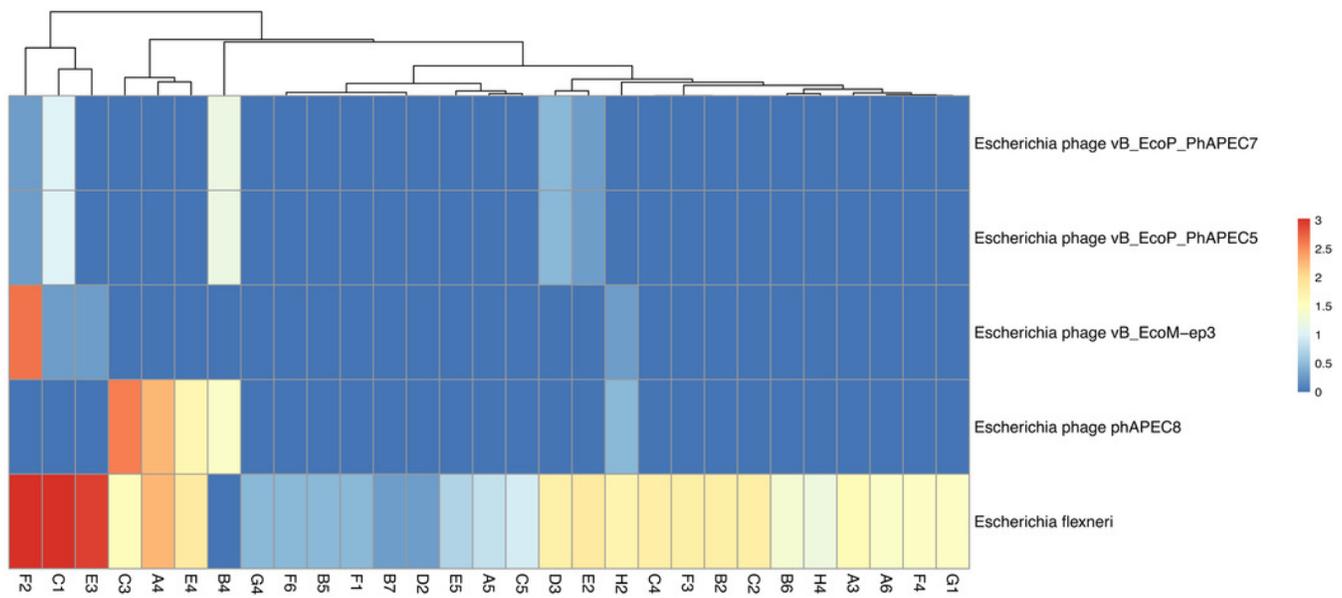

Synteny plots comparing four novel coliphage genomes recovered from chicken faecal metagenomes (in red) to closest reference genomes. The figure was generated using EasyFig.

## Figure 3

### Coliphage abundance within chicken faecal samples

Coverage of four coliphages and of putative host bacterial species. Only samples in which at least one genome had  $\geq 1x$  coverage are shown (n=29). All coverage values have been  $\text{Log}_{10}$  transformed with blue depicting low abundance and red high abundance.

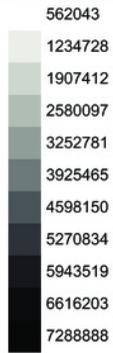

## Figure 4

Phylogenetic tree of draft MGS genomes derived from 820 metagenomic samples of the chicken gut and draft genomes of 93 species cultured from chicken faecal samples

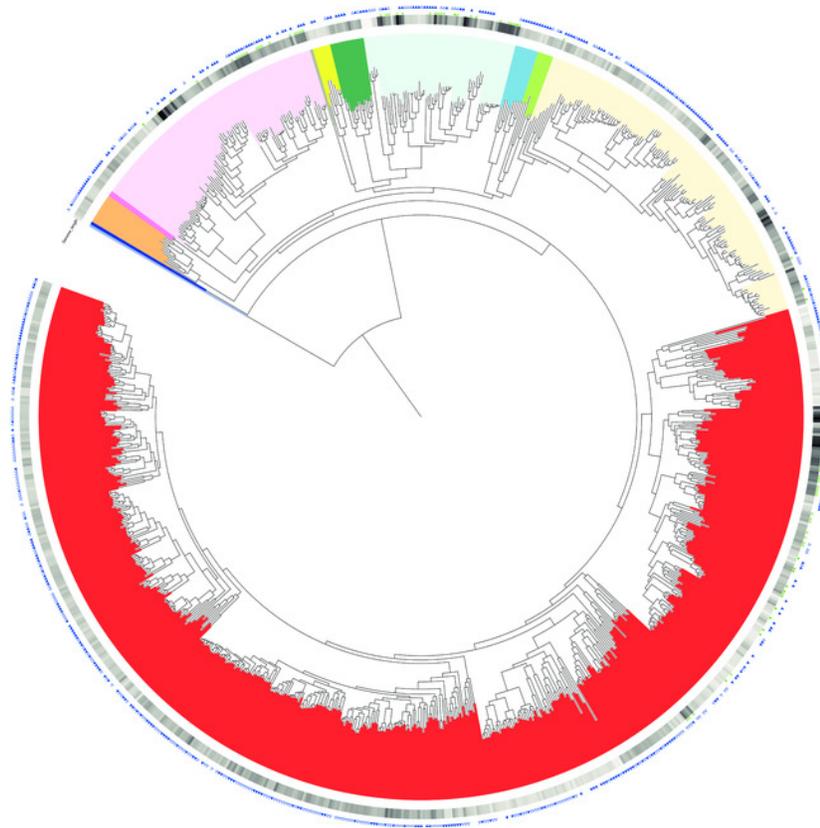

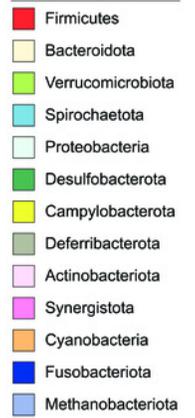

Phylum, generally as assigned by GTDB, is indicated by colour range. Data symbols in the outer layers have been used to describe further characteristics for each draft genomes. Triangles indicate sequence novelty and status of binomial designation within publicly available databases or published research with filled symbols indicating novel species assigned a binomial as part of this research, hollow symbol indicated a known species assigned a binomial as part of this research and no symbol indicated a known species with a well-formed binomial already assigned. Stars are used to indicate isolation source, with filled symbols indicating isolation of species in both culture and metagenomic assembly and hollow symbols indicating isolation in culture alone. Tree branches have been collapsed where duplicate species have been identified by different methodologies. The tree was reconstructed using PhyloPhlAn 3.0.58 against 400 marker genes before reconstruction using FastTree and RAxML of a MAFFT sequence alignment and visualised using the online iTOLv1.4 tool including provision of a heat map according to individual genome length.

Tree scale: 1

Genome size

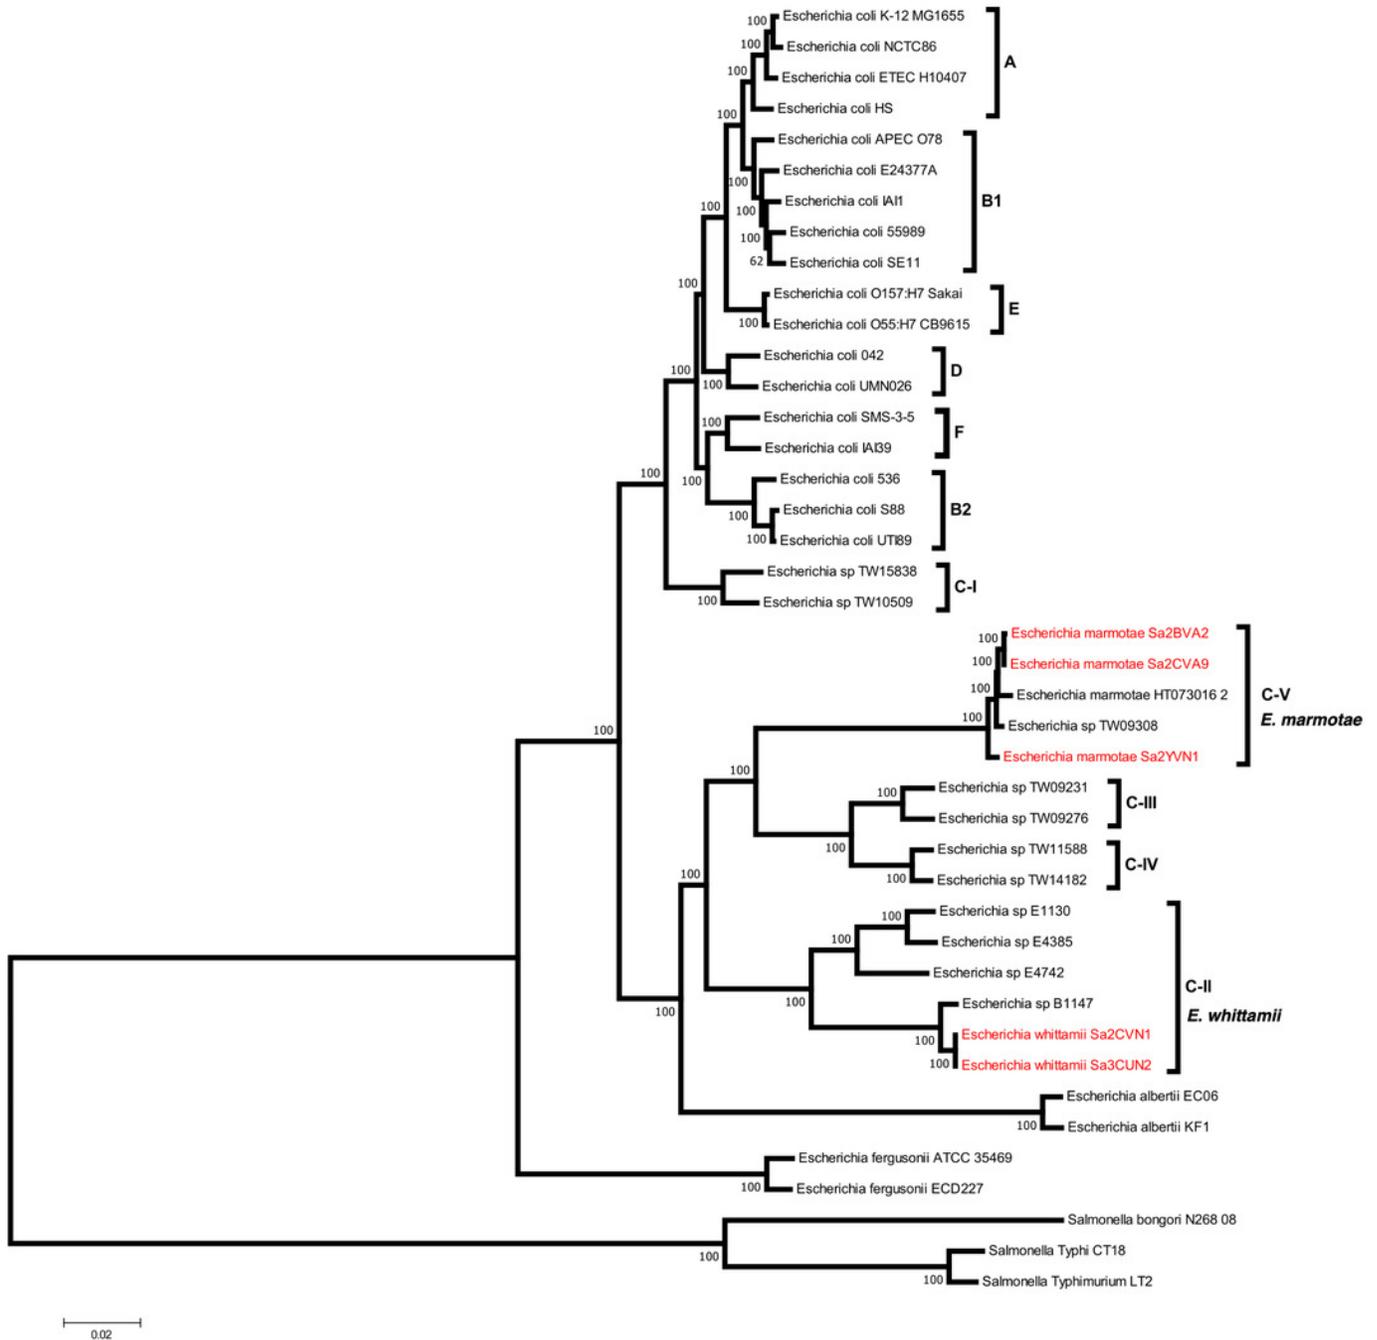

Colored ranges

## Figure 5

Phylogenetic tree showing the relationships between *Escherichia marmotae*, *Escherichia whittamii* and the other *Escherichia* species and cryptic clades

The tree was constructed by RAxML maximum likelihood analysis of a core genome alignment generated using Mugsy. The scale bar indicates the number of substitutions per site represented by the branch length shown. Numbers on branches indicate the percentage bootstrap support out of 100 replicates. Strains sequenced as part of this study are highlighted in red.

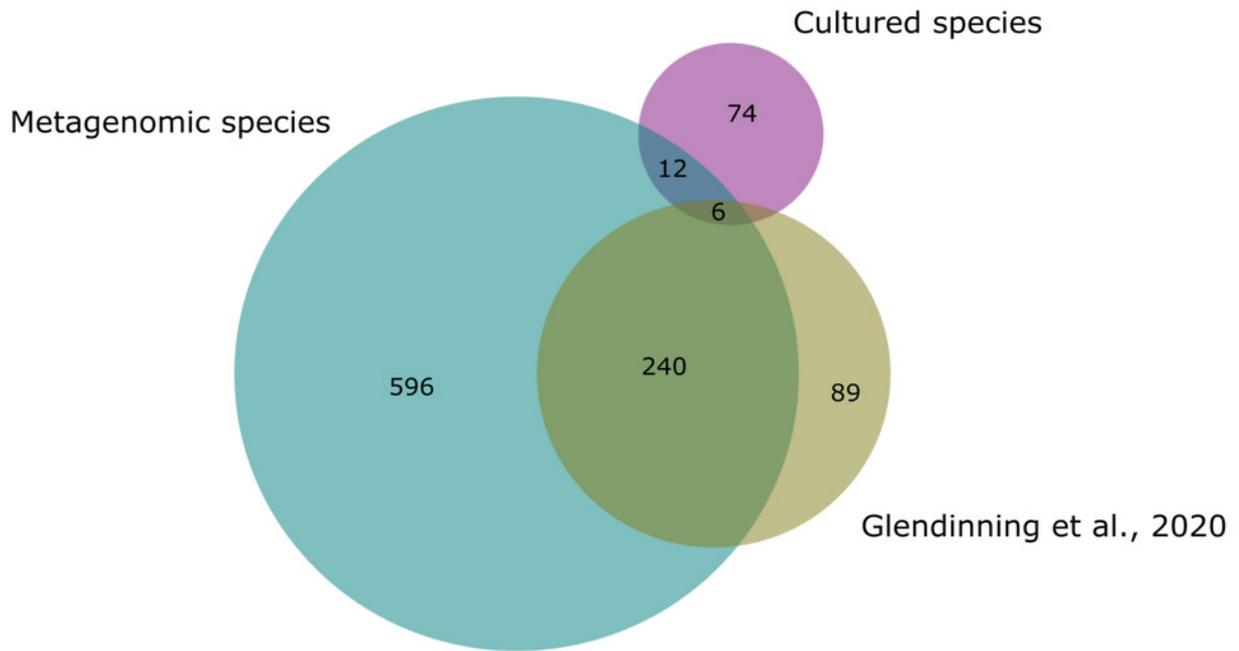

## Figure 6

### Sequence novelty

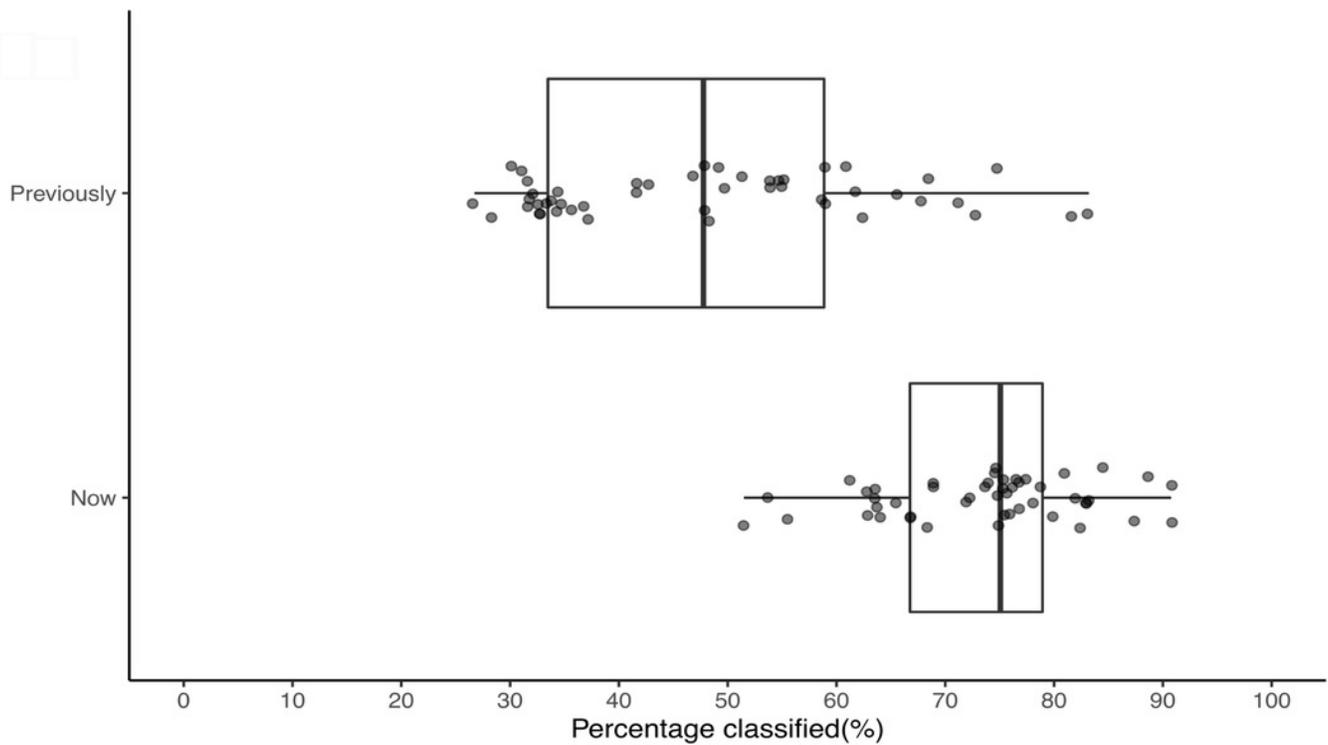

a. Venn diagram showing shared and unique taxonomic species among three data sources; cultured isolates derived from 6 chicken faecal samples (Cultured species), metagenomic species identified from a combined dataset of >630 chicken gastrointestinal metagenome samples (Metagenomic species); MAGs also found by Glendinning et al., 2020 (Glendinning et al., 2020)

b. Percentage of classified metagenomic reads derived from 50 chicken faecal samples according to a standard Kraken 2 database (Previously) and to a standard Kraken 2 database with the addition of the 2344 genomic and metagenomic sequences derived from this study (Now).

a.

b.

## Figure 7

UpSet plots depicting presence of 820 metagenomic species across all BioProjects included within this study

a. 1x coverage

b. 10x coverage.

Bars are stacked according to taxonomic species novelty, with black-stacked bars depicting novel species and grey depicting species previously described in public databases or published studies. Only intersections with 5 or more species are shown.
