Background: Clear Cell Renal Cell Carcinoma (CCRCC) is the most aggressive subtype of Renal Cell Carcinoma (RCC) with high metastasis and recurrence rates. This study aims to find new potential key genes of CCRCC. **Methods:** Four gene expression profiles (GSE12606, GSE53000, GSE68417, and GSE66272) were downloaded from the Gene Expression Omnibus (GEO) database. The TCGA KIRC database was downloaded from The Cancer Genome Atlas (TCGA). Using GEO2R, the differentially expressed genes (DEG) in CCRCC tissues and normal samples were analyzed. Gene ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) enrichment analyses were performed in DAVID database. A protein-protein interaction (PPI) network was constructed and the hub gene was predicted by STRING and Cytoscape. GEPIA and Kaplan-Meier plotter databases were used for further screening of Key genes. Expression verification and survival analysis of key genes were performed using TCGA database, GEPIA database, and Kaplan-Meier plotter. Receiver operating characteristic (ROC) curve was used to analyze the diagnostic value of key genes in CCRCC, which is plotted by R software based on TCGA database. UALCAN database was used to analyze the relationship between key genes and clinical pathology in CCRCC and the methylation level of the promoter of key genes in CCRCC. **Results:** A total of 289 up-regulated and 449 down-regulated genes were identified based on GSE12606, GSE53000, GSE68417, and GSE66272 profiles in CCRCC. The upregulated DEGs were mainly enriched with protein binding and PI3K-Akt signaling pathway, whereas down-regulated genes were enriched with the integral component of the membrane and metabolic pathways. Next, top 35 genes were screened out from the PPI network according to Degree, and three new key genes ITGAX, LAPTM5 and SERPINE1 were further screened out through survival and prognosis analysis. Further results showed that the ITGAX, LAPTM5, and SERPINE1 levels in CCRCC tumor tissues were significantly higher than those in normal tissues and were associated with poor prognosis. ROC curve shows that ITGAX, LAPTM5, and SERPINE1 have good diagnostic value with good specificity

and sensitivity. The promoter methylation levels of ITGAX, LAPTM5 and SERPINE1 in CCRCC tumor tissues were significantly lower than those in normal tissues. We also found that key genes were associated with clinical pathology in CCRCC. Conclusion: ITGAX, LAPTM5, and SERPINE1 were identified as novel key candidate genes that could be used as prognostic biomarkers and potential therapeutic targets for CCRCC.

43 expressed genes.

44 Introduction

45 Kidney cancer is a complex disease composed of a variety of cancers, showing different histology,
46 clinical course, genetic changes, and response to treatment¹. Renal Cell Carcinoma is the most
47 common tumor in the kidney, Whose morbidity and mortality are rising worldwide. Renal cell
48 carcinoma is divided into different subtypes, including clear cell renal cell carcinoma (CCRCC),
49 chromogenic cell renal carcinoma (chRCC), and papillary renal cell carcinoma (pRCC)². CCRCC
50 is a metabolic disease³, accounting for more than 80% of all renal cell carcinomas⁴. It is the most
51 aggressive subtype of renal cell carcinoma with a high rate of metastasis and recurrence^{5, 6}.
52 Although some progress has been made in the treatment of CCRCC, the current treatments of
53 CCRCC still focus on surgical treatment and traditional chemotherapy^{7, 8}. At the same time, there
54 is a lack of effective early diagnosis methods in the clinic, and some patients still have a relapse
55 and targeted drug tolerance, leading to poor prognosis of radiotherapy and chemotherapy.
56 Therefore, finding new targeted biomarkers relevant to the diagnosis and treatment of CCRCC
57 remains of paramount importance.

58 In this study, bioinformatics methods were used to obtain CCRCC gene expression data from GEO
59 database, and normal samples and CCRCC samples were selected for grouping processing. Next,
60 738 DEGs were screened, including 289 up-regulated genes and 449 down-regulated genes. And
61 then, GO enrichment analysis and KEGG signal pathway analysis were performed by DAVID.
62 The up-regulated DEGs are mainly concentrated on protein binding, plasma membrane,
63 inflammation, signal transduction, and PI3K-Akt signaling pathways, while the down-regulated
64 genes are mainly concentrated on the extracellular exosome, oxidation-reduction process, integral
65 component of membrane, protein homodimerization activity, and metabolic pathways. Finally, the
66 top 35 hub genes were screened by PPI network. Based on the novelty of ITGAX, LPTM5 and
67 SERPINE1 that have not been reported in CCRCC, the expression of these three genes is
68 significantly associated with survival prognosis and all have high degrees. Therefore, ITGAX,
69 LPTM5, and SERPINE1 were finally selected as key genes. Further analysis showed that

70 ITGAX, LAPTM5, and SERPINE1 are highly expressed in CCRCC, which are significantly
71 related to the survival prognosis of CCRCC. The methylation level of ITGAX, LAPTM5,
72 SERPINE1 in CCRCC is reduced. Moreover, ITGAX, LAPTM5 and SERPINE1 are related to
73 the Clinical pathology of CCRCC and have good diagnostic value for CCRCC. In conclusion, we
74 provided a systematic and comprehensive analysis of CCRCC and is the first to suggest that
75 ITGAX, LAPTM5, and SERPINE1 might be used as biomarkers for the new clinical diagnosis
76 and treatment of CCRCC.

77 **Materials & Methods**

78 **Data collection.** Four gene expression profiles (GSE12606, GSE53000, GSE68417, and
79 GSE66272) were downloaded from the GEO⁹ database (<http://www.ncbi.nlm.nih.gov/geo/>). The
80 TCGA KIRC database was downloaded from TCGA (<https://www.cancer.gov/about-nci/organization/ccg/research/structural-genomics/tcga>). The GSE12606¹⁰ data sets was obtained by
81 GPL570 platform, including three adjacent normal kidney specimens, and three CCRCC samples.
82 The GSE53000¹¹ and GSE68417¹² data sets were based on GPL6244 Platforms. GSE53000 data
83 sets was comprised of 60 samples including 6 adjacent normal kidney specimens and 54 CCRCC
84 samples and GSE68417 data sets was comprised of 43 samples including 14 adjacent normal
85 kidney specimens and 29 CCRCC samples. GSE66272^{13, 14} data sets was obtained by GPL5029
86 platform and contained 27 CCRCC tumor samples and 26 normal kidney samples. The TCGA
87 KIRC database contained 539 CCRCC tumor samples and 72 normal kidney samples.

88 **Study design and data processing.** In order to clarify our study, we designed a flow chart to
89 demonstrate data collection, processing, analysis and verification (FIG 1). The online tool GEO2R
90 (<http://www.ncbi.nlm.nih.gov/geo/geo2r>) is an online analysis of GEO series based on
91 the R programming language, which is used to screen DEGs between normal kidney and CCRCC
92 samples from the GSE data sets. The data was standardized and filtered to select significant DEGs.
93 P-value < 0.05, log Fold Change (|log FC|) \geq 1 were chosen as the cutoff criteria. log Fold Change
94 (|log FC|) \geq 1 means that the multiple of change is greater than or equal to 2. It is generally
95 considered that there is a difference between 2 times and more. Then, DEGs were further screened
96 according to cutoff criteria: P-value < 0.05, log FC \geq 1 as up-regulated genes, P-value < 0.05, log
97 FC \leq 1 as down-regulated genes. Finally, importing all the up-regulated genes or down-regulated
98 genes in the 4 datasets into Funrich 3.1.1 software, and taking the intersection of the up-regulated
99 genes or down-regulated genes in the 4 datasets respectively. TCGA RNA-seq simple converter
100 was used to standardize and log2 conversion of TCGA KIRC data. TCGA KIRC data were used
101 for expression verification and ROC curve analysis of Key genes.

102 **Enrichment analysis of DEGs.** DAVID 6.8 (Database for Annotation, Visualization and
103 Integrated Discovery, <https://david.ncifcrf.gov/>)^{15, 16} database was used to analyze Gene Ontology
104 (GO)¹⁷ such as the biological process (BP)¹⁸, cellular component (CC)¹⁹ and molecular function
105 (MF), and Kyoto Encyclopedia of Genes and Genomes (KEGG)²⁰ pathway enrichment analysis of
106

107 important DEGs, which promoted the visualization of gene and protein function²¹. Among them,
108 the count value represents the number of genes enriched in the pathway. The cutoff value was
109 $P < 0.05$.

110 **Protein-Protein Interaction (PPI) Network construction and hub gene screening.** The online
111 tool STRING²² (<http://string-db.org>) was utilized for the analysis of protein-protein interactions .
112 Importing all DEGs (including up-regulated genes and down-regulated genes) into the STRING
113 database for analysis, and the confidence level ≥ 0.4 is considered to be significant for PPI.
114 STRING and Cytoscape software (version 3.6.1) were used to construct the PPI network, which is
115 regarded as a network software platform for visualizing protein molecular interactions. Using the
116 degree algorithm in the cytohubba plug-in of Cytoscape, the degree value could be calculated and
117 thus the hub genes could also be screened from PPI network. The importance of genes is directly
118 related to the degree of protein. According to the degree value (degree ≥ 37), the first 35 genes
119 were selected as hub genes. Three key genes ITGAX, LAPTM5 and SERPINE1 with high degree
120 were screened through survival and prognosis analysis as well as the novelty of genes.

121 **Key genes analysis and verification.** Three key genes were analyzed and verified comprehensively
122 by using TCGA, GEPIA, Oncomine, Kaplan-Meier plotter and UALCAN databases. Similarly,
123 TCGA database also applied to ROC curve analysis. ROC curve was plotted by R software, which
124 could be used to analyze the diagnostic value of key genes in CCRCC. GEPIA ([http://gepia.cancer-](http://gepia.cancer-pku.cn/)
125 [pku.cn/](http://gepia.cancer-pku.cn/)) analyzed the expression of key genes in CCRCC. Oncomine²³ (<http://www.on>
126 [comine.org](http://www.on)) was a database consisting of microarray data of various tumors, which verified the
127 expression of key genes in CCRCC. Kaplan-Meier Plotter (<http://kmplot.com/analysis/index>) was
128 used to analyze the survival of key genes in CCRCC. UALCAN²⁴ (<http://ualcan.path>
129 [uab.edu/index.html](http://ualcan.path)) online database was used to analyze the relationship between key genes and
130 Clinical pathology in CCRCC, and the promoter methylation level of key genes in CCRCC was
131 analyzed.

132 **Statistical analysis.** Statistically significant differences between the normal tissues group and
133 tumor tissues group were determined using Student's t tests. Also, Kaplan-Meier analysis was
134 used to assess OS. ROC curve is a graphical plot²⁵ that reflects the sensitivity and specificity of
135 continuous variables. $P < 0.05$ was considered to be statistically significant for all the tests. All
136 the statistical analyses applied GraphPad prism 6.0 or R software.

137 Results

138 **Volcano plots of the differentially expressed genes in four datasets.** The data sets of CCRCC,
139 which were GSE12606, GSE53000, GSE68417 and GSE66272, were downloaded from the GEO
140 database (Table 1) and analyzed by GEO2R separately. A total of 9,560 DEGs were screened from
141 the GSE12606 data sets, among which 1568 genes were up-regulated and 5436 genes were down-
142 regulated instead. A total of 1,286 DEGs were screened from the GSE53000 data sets, among
143 which 583 were up-regulated and 708 were down-regulated. A total of 1,890 DEGs were screened
144 from the GSE68417 data sets among them 726 up-regulated and 1,164 down-regulated genes were
145 selected. There were 3,627 up-regulated genes and 5,170 down-regulated genes among the 8,797
146 DEGs screened from the GSE66272 data sets. The screening criteria were P -value < 0.05 , log Fold

147 Change ($|\log FC| \geq 1$). All of the DEGs from the four data sets were presented in Volcano plots
148 (FIG 2A-D). Among them, red represents high-expressed genes, green represents low-expressed
149 genes, and black represents genes whose expression levels are not significant in each data set. We
150 gained the intersection of four independent data sets through Funrich 3.1.1 software and made a
151 visualization analysis of Venn Diagram. After being overlapped, the common 738 genes
152 (supplementary FIG.1) were identified, including 289 up-regulated and 449 down-regulated genes
153 (FIG 2E-F).

154 **GO and KEGG enrichment analysis of DEGs.** To further explore the function of DEGs,
155 enrichment analysis of up-regulated genes and down-regulated genes were displayed respectively.
156 DAVID 6.8 was used to perform GO and KEGG analysis of DEGs in CCRCC (Table 2). In
157 biological processes, up-regulated DEGs are mostly involved in cell adhesion, signal transduction,
158 immune response, especially the regulation of inflammatory response (FIG 3A); while down-
159 regulated DEGs are mostly involved in oxidation-reduction process proteolysis, ion
160 transmembrane transport, response to drug, and ion transport (FIG 3E). In terms of cellular
161 components, up-regulated DEGs are mainly distributed in the plasma membrane, integral
162 component of the membrane, extracellular exosome, and membrane (FIG 3B); down-regulated
163 DEGs are mainly distributed in integral component of membrane, plasma membrane, cellular
164 exosomes, and integral component of plasma membrane (FIG 3F). In terms of molecular function,
165 up-regulated DEGs generally have protein binding, identical protein bind, ATP binding capacity,
166 and protein homodimerization activity (FIG 3C); down-regulated DEGs generally have identical
167 protein homodimerization activity, calcium ion binding, sequence-specific DNA binding, and
168 oxidoreductase activity (FIG 3G). In the KEGG signal pathway, the up-regulation of DEGs mostly
169 involved in the PI3K-Akt signaling pathway, pathways in cancer, focal adhesion, and HIF-1
170 signaling pathway (FIG 3D); while the down-regulation of DEGs mainly involved in the metabolic
171 pathway, Biosynthesis of antibiotics, Carbon metabolism, and Aldosterone-regulated sodium
172 reabsorption (FIG 3H). CCRCC is a kind of metabolic disease. Metabolic reprogramming covers
173 different processes including aerobic glycolysis, fatty acid metabolism and the utilization of
174 tryptophan, glutamine as well as arginine²⁶, which has also been proved by the results of KEGG
175 pathway enrichment analysis in the work. KEGG pathway results show that down-regulated DEGs
176 are enriched in metabolic pathways, Glycolysis/Gluconeogenesis, Glycine, serine and threonine
177 metabolism and so on.

178 In addition, GO and KEGG enrichment analyses were performed for all DEG (up-regulated and
179 down-regulated genes) (supplementary FIG.2). Finally, 11 common enrichment results were found
180 from the three analyses (including up-regulated DEG, down-regulated DEG and all DEG
181 enrichment analyses). The common enrichment results are as follows: response to drug, plasma
182 membrane, integral component of membrane, extracellular space, extracellular exosome, cell
183 surface, cell surface, protein homodimerization activity, identical protein binding. The results of
184 enrichment analysis were consistent with previous studies^{27, 28}. It suggests that these 11 pathways
185 may be important in CCRCC.

186 **Construction of PPI network and screening of key genes.** To identify the key genes, the STRING
187 online database and Cytoscape software were used to analyze all DEGs (including up-regulated
188 genes and down-regulated genes) and construct PPI network (FIG 4A). Based on the main role of
189 proteins in biological functions, their interaction determines the molecular and cellular
190 mechanisms that control the health and disease state of the organism²⁹. Next, using the degree
191 algorithm in the cytohubba plug-in of Cytoscape to screen the hub genes in PPI network. The gene
192 whose degree ≥ 37 could be defined hub gene, therefore the first 35 genes (Table 3) in the PPI
193 network were chosen to be hub genes (FIG 4D). Next, GO enrichment analysis was conducted for
194 all DEGs and the first 35 DEGs in the PPI network. The result showed that all DEGs mainly
195 enriched in signal transduction, oxidation-reduction process, cell adhesion, inflammatory
196 response, plasma membrane, integral component of membrane, extracellular exosome, integral
197 component of plasma membrane (FIG 4B-C). The top 35 DEGs were enriched in extracellular
198 space, extracellular exosome, inflammatory response, an integral component of the plasma
199 membrane, and cell surface (FIG 4E). By comparison, it turned out that the enrichment analysis
200 results of all DEGs in PPI network contained the results of the top 35's. In the end, three new key
201 genes with high degree which were ITGAX, LAPTM5 and SERPINE1, could be screened by using
202 GEPIA and Kaplan-Meier plotter database.

203 **The expression of key genes.** Among the 35 genes, we focused on ITGAX, LAPTM5, and
204 SERPINE1, which have not been reported to be related to the occurrence and development of
205 CCRCC. Firstly, the expression levels of ITGAX, LAPTM5, and SERPINE1 in CCRCC tumor
206 tissues are significantly higher than those in normal tissues adjacent to cancer according to GEPIA
207 database (FIG 5A-C). Furthermore, the data of TCGA KIRC showed that compared with adjacent
208 normal tissues, the mRNA expressions of ITGAX, LAPTM5, and SERPINE1 in 72 pairs of
209 CCRCC tissues were significantly increased (FIG 5D-F). In the Oncomine Gumz renal database,
210 the mRNA levels of ITGAX, LAPTM5 and SERPINE1 were also upregulated in CCRCC tissues
211 when compared with adjacent normal kidney tissues (FIG 5H-G). According to the UALCAN
212 database, the promoter methylation levels of ITGAX, LAPTM5 and SERPINE were decreased in
213 CCRCC (FIG 5J-L). To sum up, according to the GEPIA database, Oncomine Gumz renal database
214 and TCGA database, the expression levels of these three genes in CCRCC tumor tissues are
215 significantly higher than those in normal tissues adjacent to cancer. It could be further speculated
216 that the high expression of ITGAX, LAPTM5, and SERPINE1 in CCRCC tumor tissue might be
217 related to the decrease of promoter methylation.

218 **The association of key genes expression with clinical pathology in CCRCC.**

219 Furthermore, the relationship between the mRNA expression of ITGAX, LAPTM5 and
220 SERPINE1 and different clinical pathology grades were measured. The results showed that their
221 mRNA expression was significantly related to pathological grades (FIG 6A-C). And the expression
222 of ITGAX, LAPTM5, and SERPINE1 mRNA in CCRCC samples are also significantly correlated
223 with severe clinical staging (FIG 6 D-F). Among them, the expression levels of ITGAX, LAPTM5,
224 and SERPINE1 were higher in stage 4 and grade 4. In conclusion, ITGAX, LAPTM5, and
225 SERPINE1 are significantly associated with clinical pathology.

226 ***Survival and diagnostic value of ITGAX, LAPTM5, and SERPINE1 in CCRCC.*** According to
227 the Kaplan-Meier plotter databases, the overall survival of ITGAX, LAPTM5, and SERPINE1
228 genes was tested (FIG 7A-C). The results showed that the high expression of three key genes in
229 CCRCC was negatively correlated with prognosis. Then, the ROC curve was used to evaluate the
230 difference between CCRCC and the normal tissues in the TCGA datasets. The ROC curves (FIG
231 7D-E) of these three genes showed that their area under the curve (AUC) and the 95%
232 confidence intervals (CI) are as follows: ITGAX (AUC=96.315, CI=0.9423-0.9840), LAPTM5,
233 (AUC=94.808 CI=0.9243-0.9719), and SERPINE1(AUC=76.272, CI:0.7068 to 0.8186). Since
234 ROC curves had good specificity and sensitivity, ITGAX, LAPTM5, and SERPINE1 had
235 excellent diagnostic efficiency for distinguishing tumors and normal tissues.

236 **Discussion**

237 Clear Cell Renal Cell Carcinoma (CCRCC) is a metabolic disease whose morbidity is rising
238 worldwide. The feature of kidney cancer is to participate in the target genes' mutation of
239 metabolic pathways²⁶. Recently, with the application of bioinformatics, the molecular
240 characteristics of CCRCC have been greatly improved and the development of targeted therapy
241 has been promoted. These advances have significantly improved the median survival of patients
242 with advanced disease. However, about 30% of CCRCC local patients will still relapse or
243 metastasize after surgical removal of the tumor³⁰. Around 1/3 of the metastatic patients had poor
244 prognosis and rare high drug resistance rate. Under the circumstance of different treatment, the
245 identification of biomarkers was needed urgently so as to predict the drug's effects³¹. Therefore,
246 identification of CCRCC key genes and prognostic judgment is still very crucial. In our research,
247 some reported genes related to CCRCC, such as VEGFA³², EGFR³³, were also screened out.
248 Vascular Endothelial Growth Factor A (VEGFA) is a member of the PDGF/VEGF growth factor
249 family. VEGFA has a potential role in the diagnosis and treatment of CCRCC. VEGFA can inhibit
250 the proliferation of CCRCC 786-O cells, promote cell apoptosis, and inhibit cell migration and
251 invasion³². Epidermal growth factor receptor (EGFR) is closely related to the progression of many
252 epithelial malignancies and is an important therapeutic target³³. EGFR is a cell surface protein,
253 belonging to the ERBB family. EGFR binds to epidermal growth factor to induce receptor
254 dimerization and tyrosine self phosphorylation, which eventually leads to cell proliferation³⁴.
255 EGFR can activate a variety of signaling pathways, mainly MAPK / ERK and PI3K / AKT
256 pathways³⁵. Compared with the former 4 studies, this study found three new key genes which were
257 ITGAX, LAPTM5 and SERPINE1, and applied several methods to do functional analysis and
258 systematic research to key genes such as methylation level analysis, survival analysis, ROC curve
259 analysis and so on. In previous studies, GSE12606 mainly focused on the functional analysis of
260 HLA ligand in CCRCC, while GSE5300 mainly focused on the structure and revolution of CCRCC
261 genome, and GSE66272 mainly focused on the role of miRNA in CCRCC and GSE68417 mainly
262 focused on the analysis to the gene expression profile of CCRCC. On the contrary, this study put
263 emphasis on screening the biomarkers used to do early diagnosis in CCRCC and analyzing the
264 intersection of DEGs in four datasets.

265 Besides, three new potential marker genes ITGAX, LAPTM5, SERPINE1 were also screened out
266 and proved. Integrin alpha x (ITGAX) is a member of the integrin family, commonly function as
267 a receptor for extracellular matrix. It is reported that ITGAX is involved in the angiogenesis of
268 dendritic cells and tumor angiogenesis³⁶. In addition, ITGAX is identified as a new type of
269 aggressive prostate cancer susceptibility gene³⁷. Lysosomal protein transmembrane 5 (LAPTM5),
270 known as E3 protein, may play a role in hematopoiesis and prevent excessive activation of
271 lymphocytes³⁸. It is reported that LAPTM5 can regulate the proliferation and viability of bladder
272 cancer cells, leading to cell cycle arrest in the G0/G1 phase³⁹. LAPTM5 is also associated with the
273 spontaneous regression of neuroblastoma⁴⁰. Studies have shown that Serpin family E member 1
274 (SERPINE1) is a regulator of Glioblastoma (GBM) cell proliferation, and is related to poor
275 prognosis of patients and mesenchymal GBM. Down-regulation of SERPINE1 in primary GBM
276 cells inhibited the growth and invasiveness of tumors in the brain, and SERPINE1 plays a key role
277 in the spread of GBM⁴¹.

278 Conclusions

279 To sum up, the expression levels of ITGAX, LAPTM5, SERPINE1 in CCRCC tumor tissues are
280 significantly higher than those in normal tissues adjacent to cancer and are related to the tumor
281 stage and tumor grade. ITGAX, LAPTM5, and SERPINE1 have high diagnostic efficiency for
282 tumors and normal tissues, and their expressions are associated with poor prognosis of CCRCC.
283 The decrease of promoter methylation of ITGAX, LAPTM5 and SERPINE1 in CCRCC tumor
284 tissues indicates that the high expression of key genes in CCRCC might be relevant to the low
285 methylation level. The limitation of this study lied in that the internal molecular mechanisms where
286 key genes played a role remained unclear, which need a further research. Further studies are needed
287 to explore the detailed mechanisms of these key genes in CCRCC. In conclusion, we identified
288 ITGAX, LAPTM5, and SERPINE1 as potential marker genes of CCRCC by bioinformatics
289 methods, providing insights for future therapeutic design. Meanwhile, we conducted a relatively
290 systematic and comprehensive analysis on CCRCC data, thereby providing a theoretical basis for
291 identifying therapeutic targets of CCRCC, promoting early detection, and monitoring tumor
292 progression.

Figure 1

Flow chart of data collection, processing, analysis and verification in this study.

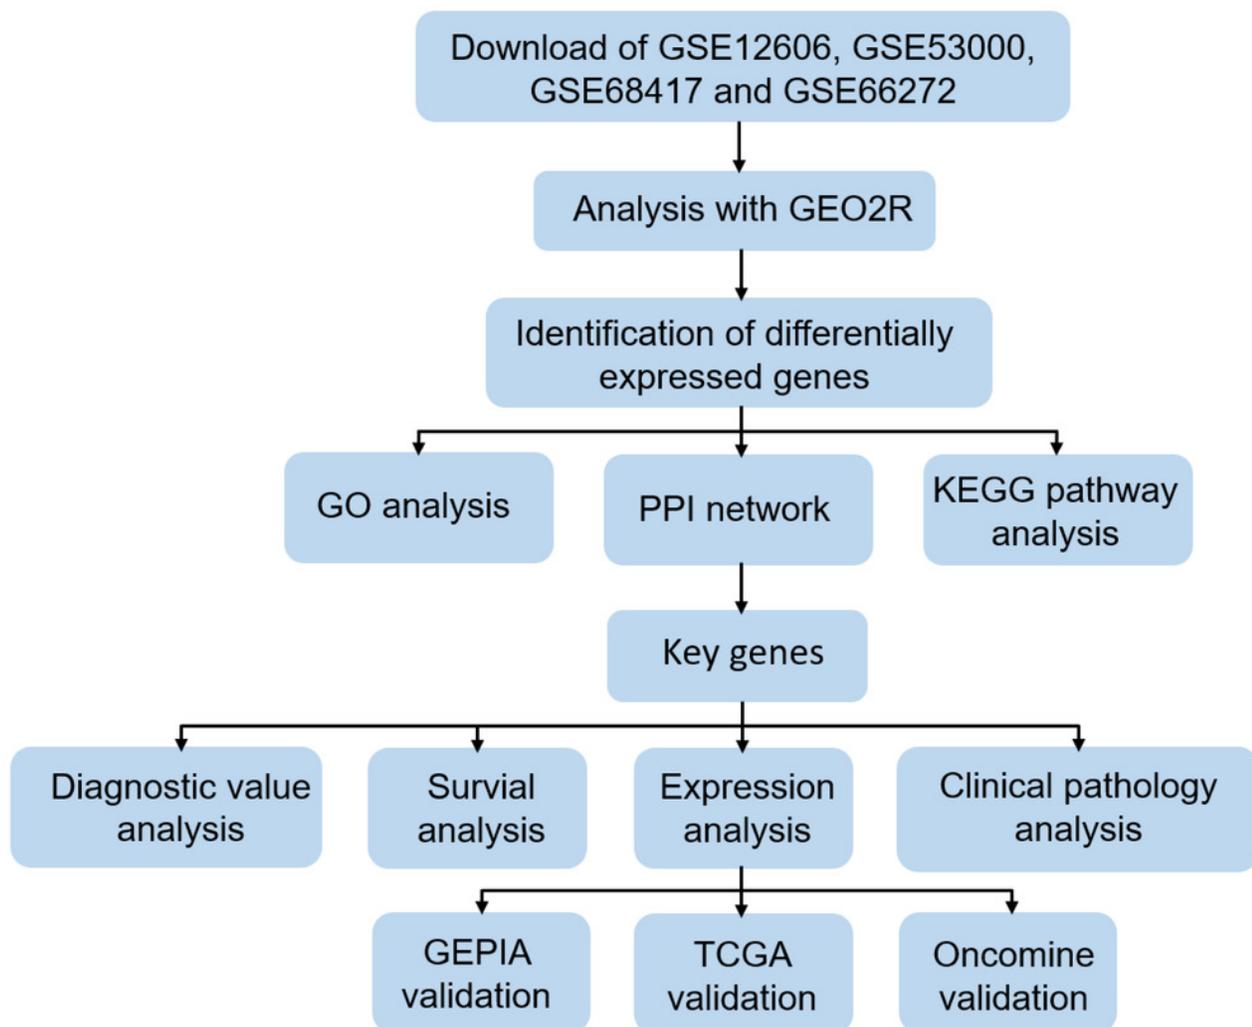

Figure 2

Screening of differentially expressed genes.

(A-D) The volcano plot of all DEGs respectively in GSE12606, GSE53000, GSE68417, and GSE66272 datasets. Red and green nodes represent up-regulated genes and down-regulated genes, respectively. (E-F) 738 DEGs were identified in four profile datasets (GSE12606, GSE53000, GSE68417, and GSE66272), 289 upregulated genes, 449 downregulated genes.

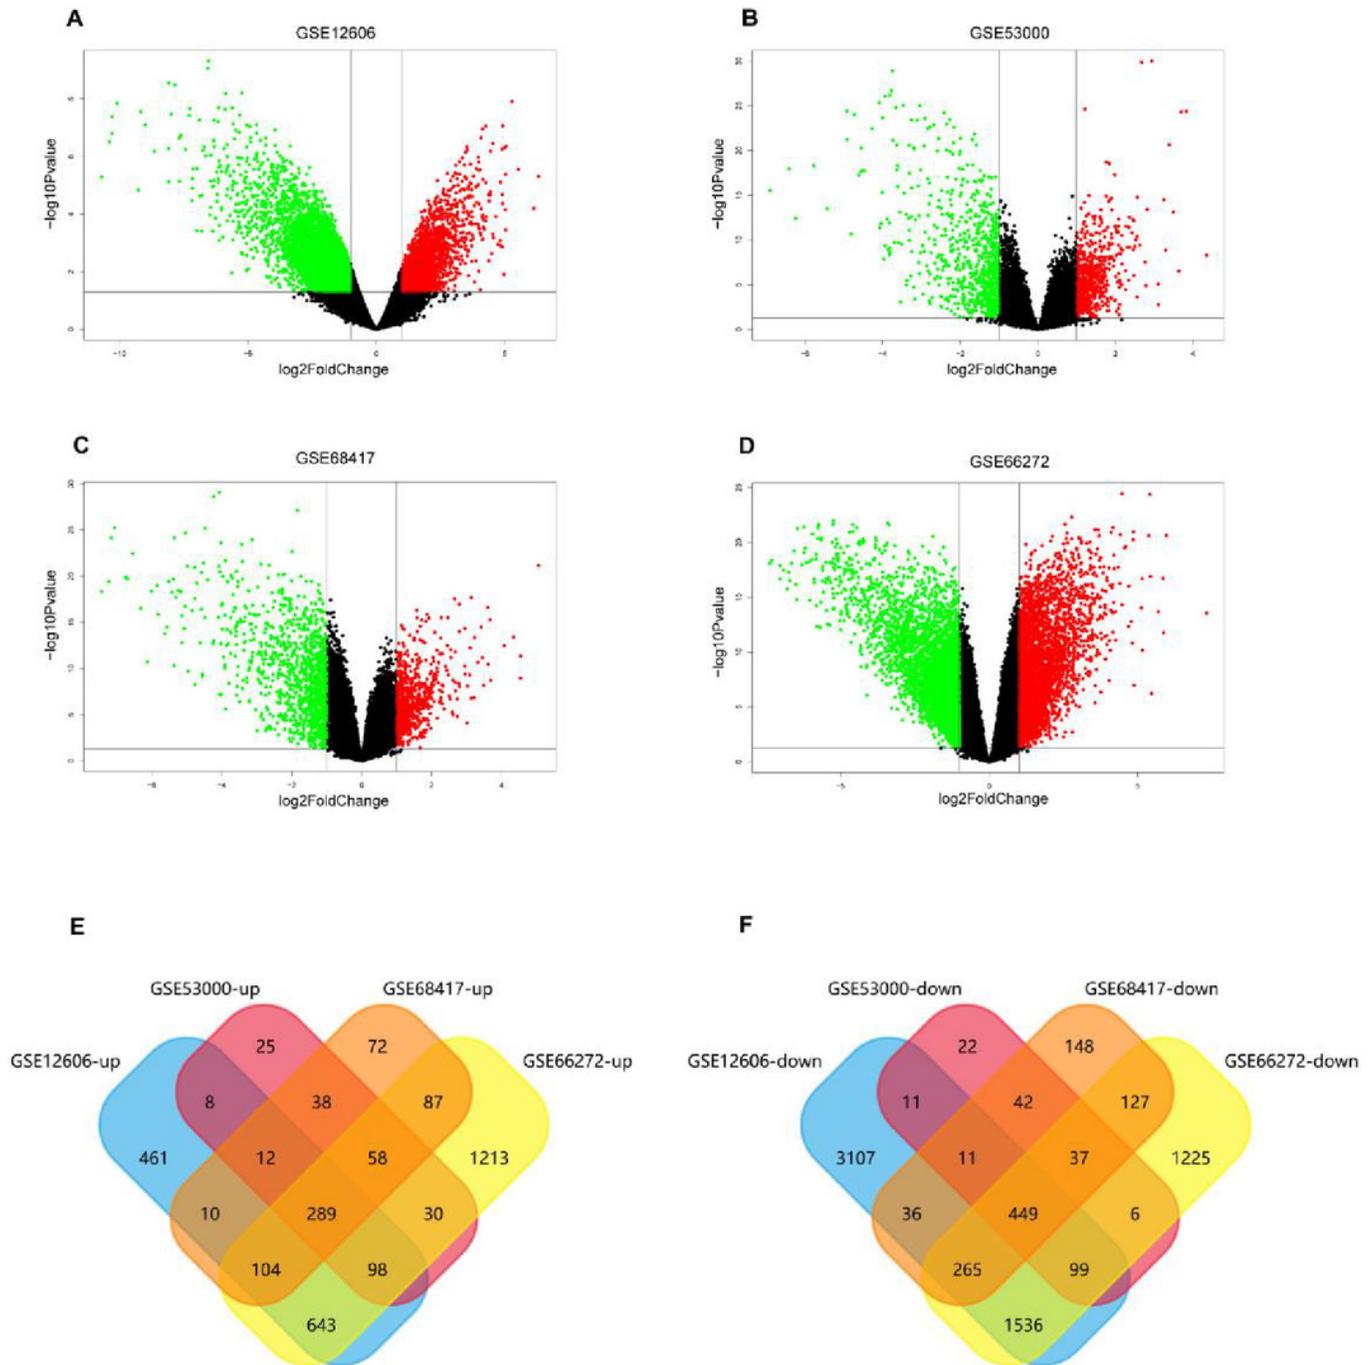

Figure 3

Enrichment analysis of GO and KEGG with up-regulated DEG.

(A) The biological process of GO analysis showed that the up-regulation of DEGs was mainly related to cell adhesion, inflammatory response, signal transduction, and immune response.

(B) The enrichment analysis of up-regulated DEGs cell components is mainly related to the cellular exosomes, integral component of membrane, plasma membrane, and integral component of plasma membrane. (C) The molecular function of GO analysis showed that the up-regulation of DEGs was mainly related to protein binding, identical protein bind, ATP binding capacity, and protein homodimerization activity. (D) The KEGG pathways related to the up-regulation of DEGs expression mainly include the PI3K-Akt signaling pathway, focal adhesion, pathways in cancer, and HIF-1 signaling pathway. (E) The biological process of GO analysis showed that the downregulation of DEGs was mainly related to oxidation-reduction process proteolysis, ion transmembrane transport, response to the drug, and ion transport. (F) The enrichment analysis of down-regulated DEGs cell components is mainly related to integral components of membrane, plasma membrane, cellular exosomes, and integral component of plasma membrane. (G) The molecular function of GO analysis showed that the downregulation of DEGs was mainly related to protein homodimerization activity, calcium ion binding, oxidoreductase activity, and sequence-specific DNA binding. (H) The KEGG pathways related to the down-regulation of DEGs expression mainly include metabolic pathway, Biosynthesis of antibiotics, Carbon metabolism, and Aldosterone-regulated sodium reabsorption.

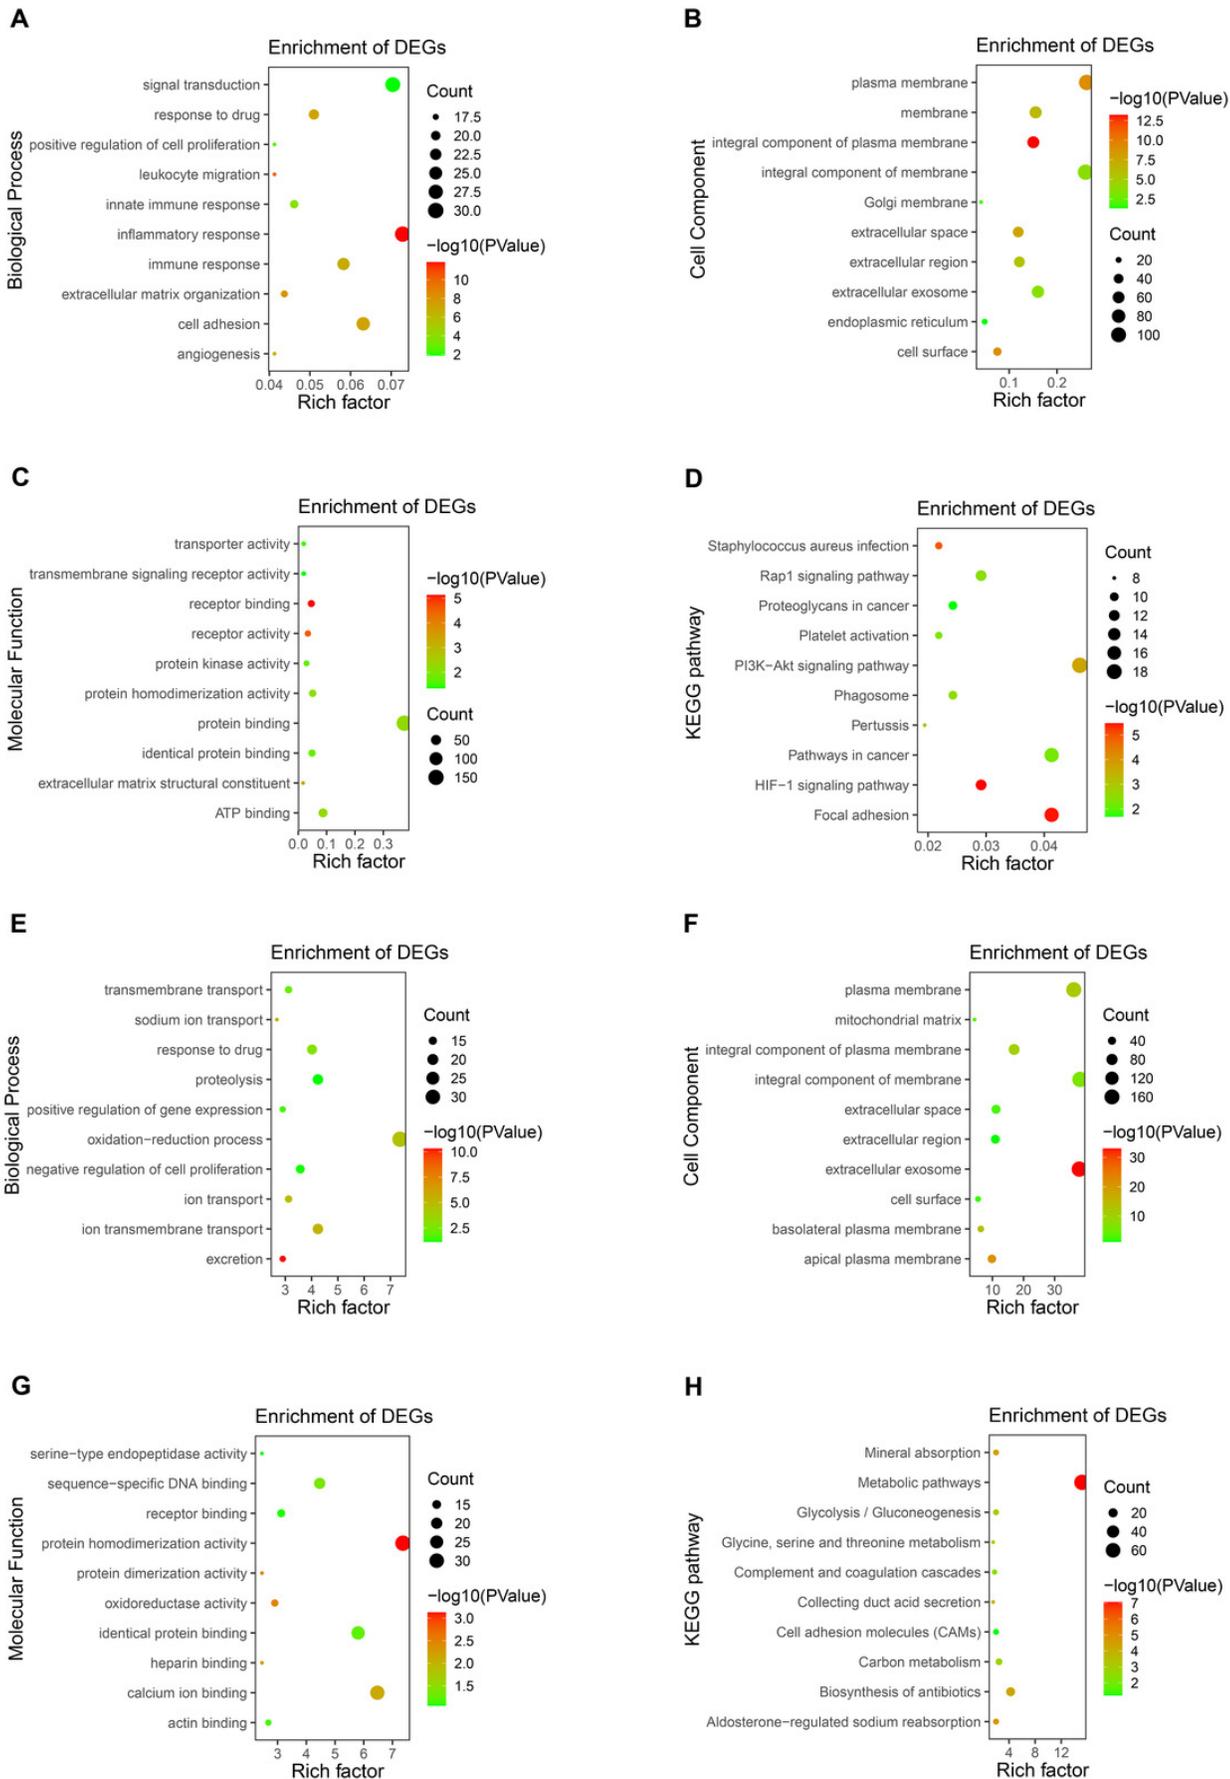

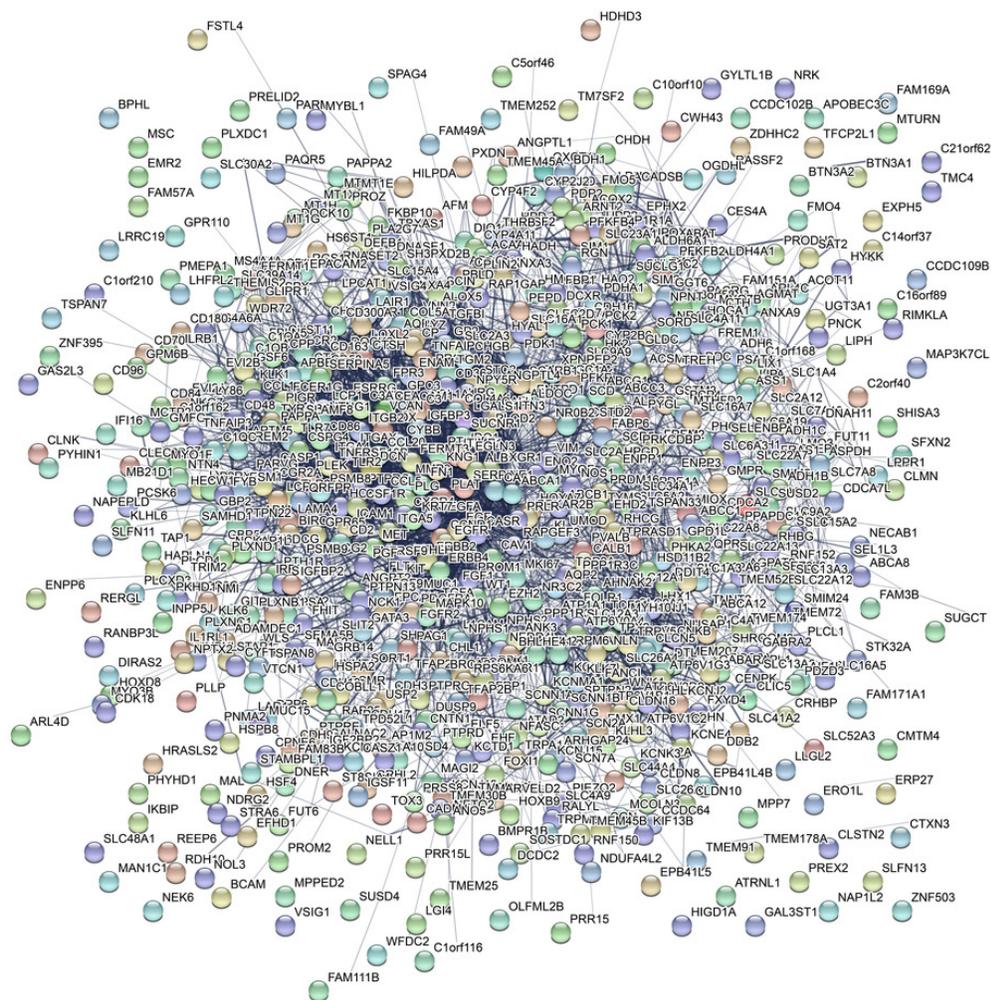

Figure 4

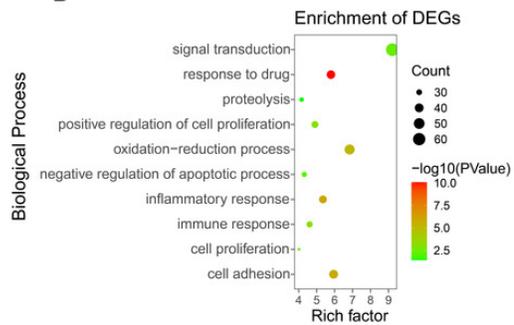

PPI network and GO enrichment analysis of key genes.

(A) The PPI network is constructed, including up-regulated genes and down-regulated genes, and considers that the confidence level ≥ 0.4 is significant for PPI. (B-C) GO enrichment analysis of all DEGs in PPI network. (D) PPI network of the top 35 DEGs according to the degree (degree ≥ 37). (E) GO enrichment analysis of the top 35 DEGs.

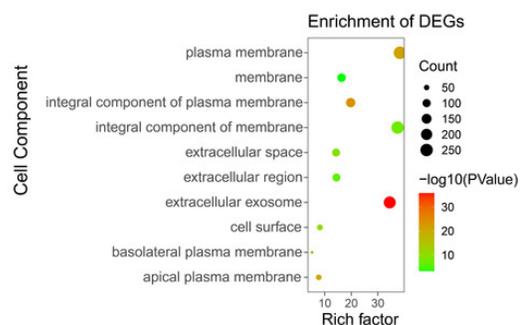

A

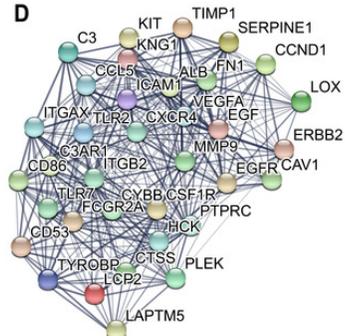

B

C

D

E

GO enrichment analysis of the top 35 DEGs.

Term	Count (≥ 5)	P-value
GO-CC: 0005615~extracellular space	11	2.531E-06
GO-CC: 0070062~extracellular exosome	11	1.313E-03
GO-BP: 0006954~inflammatory response	6	8.250E-05
GO-CC: 0005887~integral component of plasma membrane	6	1.554E-02
GO-CC: 0009986~cell surface	5	2.203E-03

Figure 5

Key gene expression between normal kidney and CCRCC tissues.

(A-C) Box plot showing the expression of ITGAX, LAPTM5, SERPINE1 in GEPIA database. These three genes are highly expressed in CCRCC. (D-F) In the TCGA database, compared with adjacent normal tissues, the expression of ITGAX, LAPTM5, SERPINE1 mRNA in 72 pairs of CCRCC tissues increased significantly. (G-I) The expression of ITGAX, LAPTM5, SERPINE1 are significantly increased in Oncomine Gumz renal database. *P < 0.05, **P < 0.01, ***P < 0.001. (J-L) The box plot showing the promoter methylation levels of ITGAX, LAPTM5 and SERPINE1 in the UALCAN database. P < 0.01.

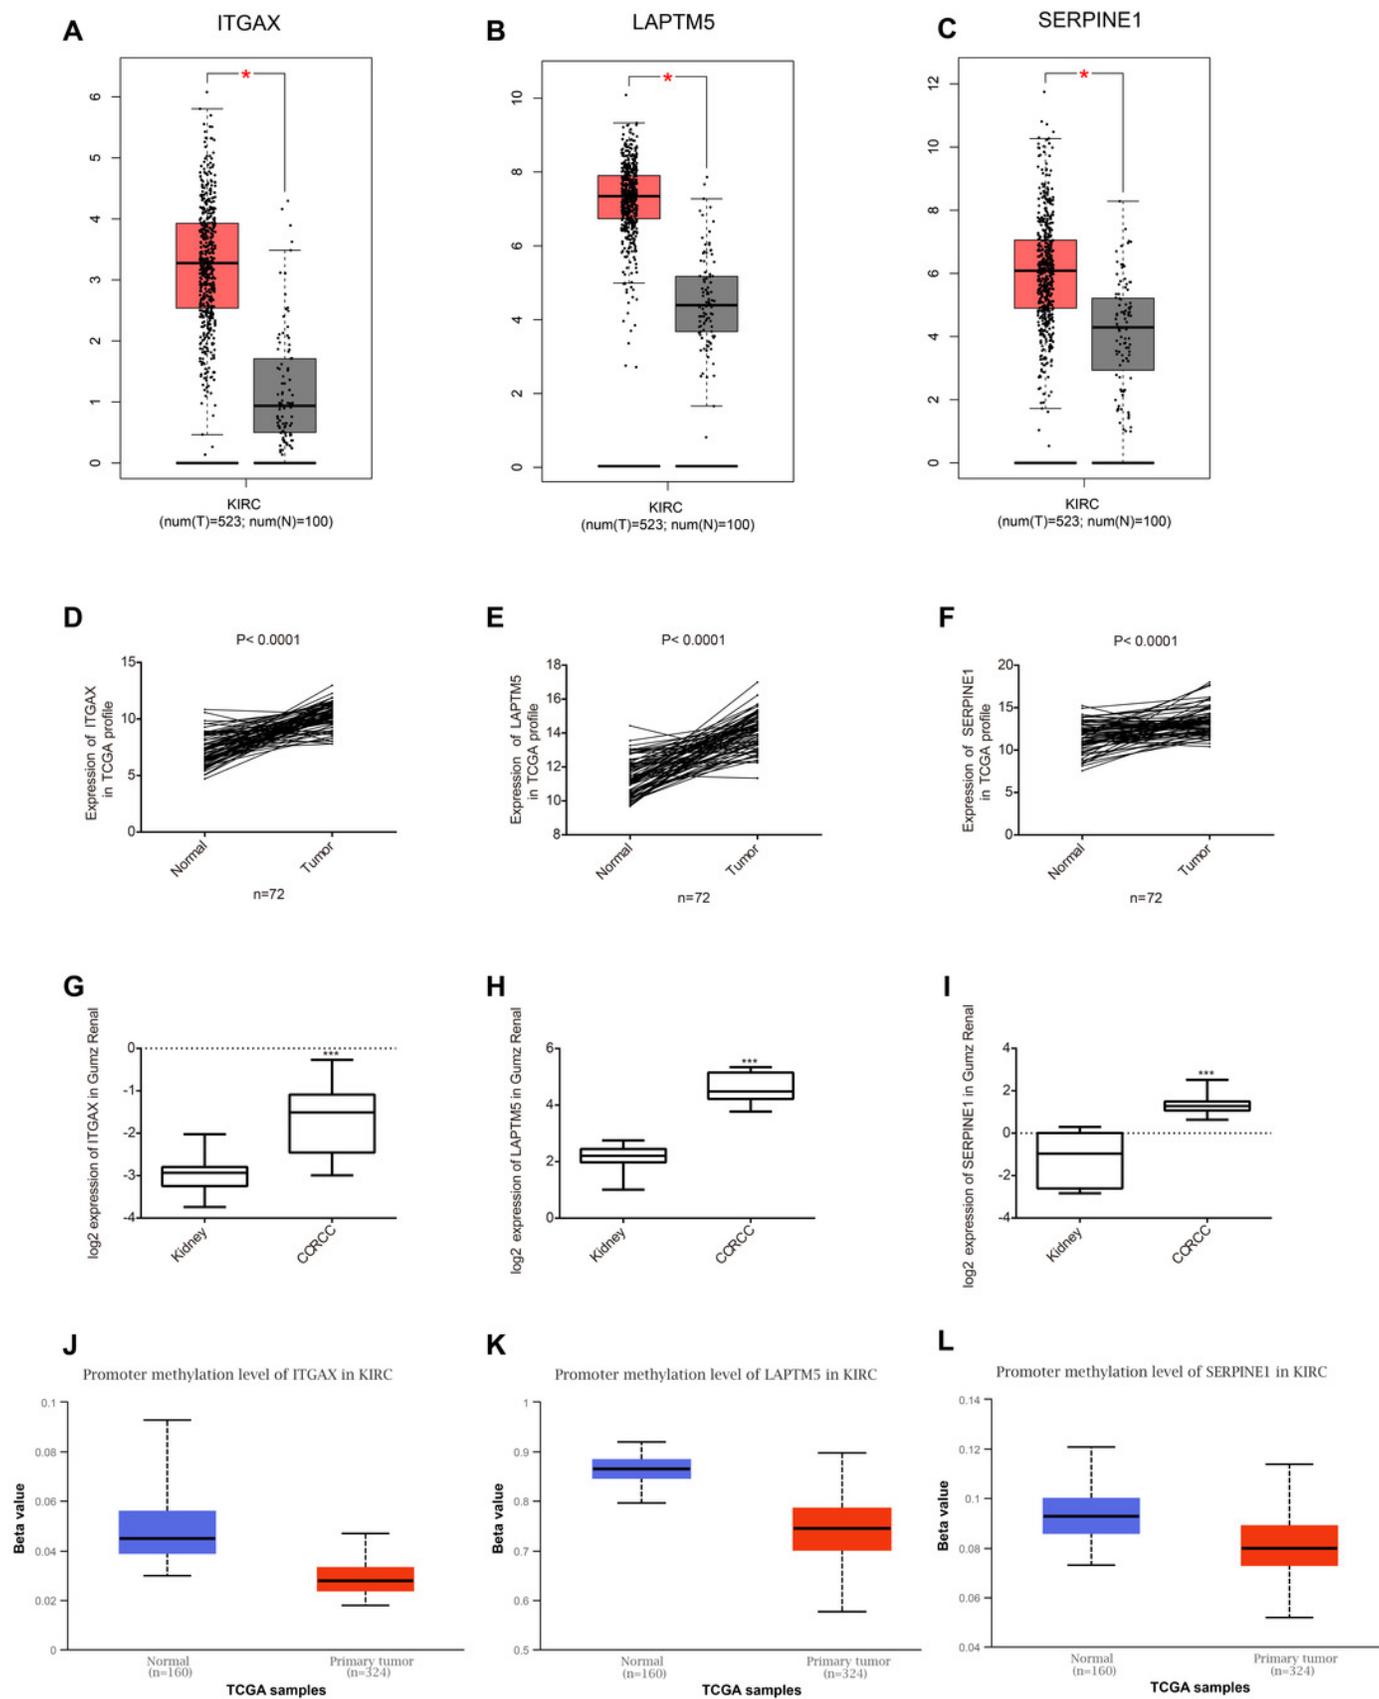

Figure 6

The relationship between ITGAX, LAPT5, and SERPINE1 expression and clinical pathology of CCRCC.

(A-C) Boxplot showing that ITGAX, LAPT5, and SERPINE1 mRNA expression were significantly related to pathological grades, and patients in grade 4 have the highest expression in CCRCC according to UALCAN databases. (D-F) Boxplot showing that the expression of ITGAX, LAPT5, and SERPINE1 mRNA in CCRCC samples are significantly correlated with severe clinical staging and the mRNA expression of ITGAX, LAPT5, and SERPINE1 were higher in patients with stage 4 according to UALCAN databases. *P < 0.05, **P < 0.01, ***P < 0.001.

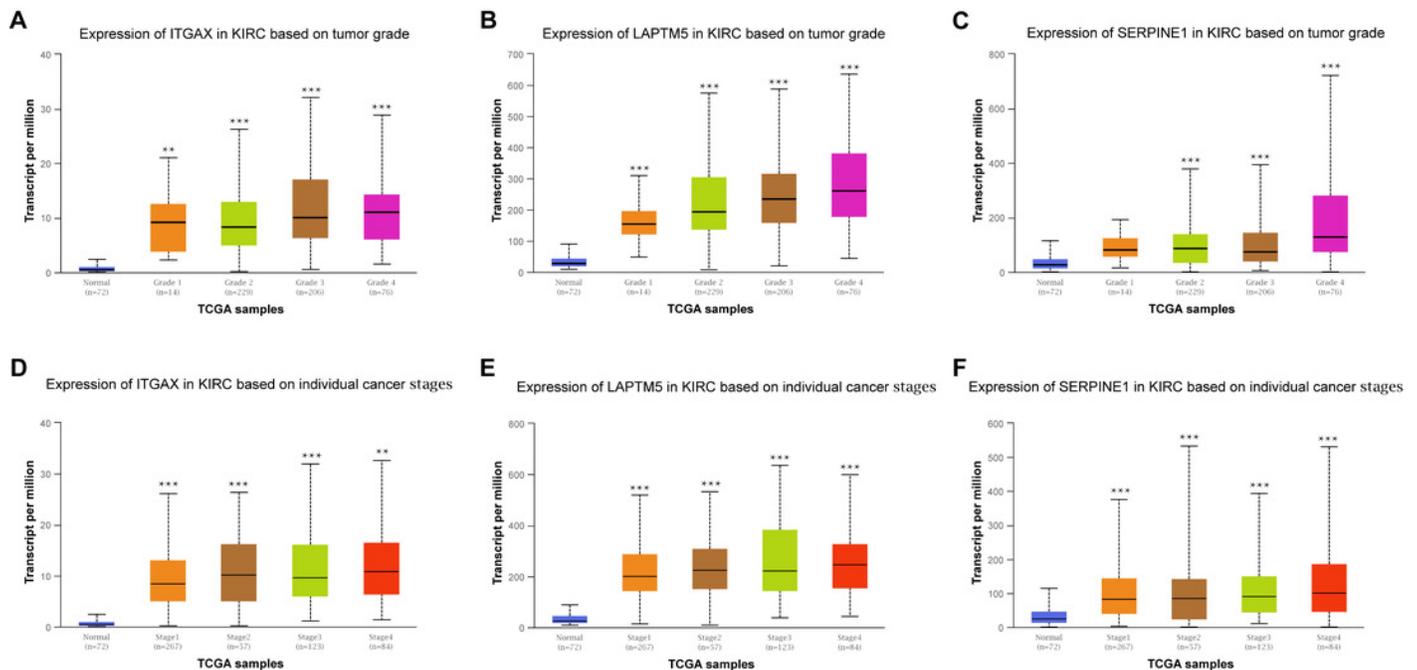

Figure 7

Survival and diagnostic value of ITGAX, LAPTM5, and SERPINE1 in CCRCC

(A-C) The overall survival of ITGAX, LAPTM5, and SERPINE1. The results showed that the high expression of three key genes in CCRCC was negatively correlated with prognosis. (D) ROC curve of ITGAX (AUC=96.315, cutoff value=8.836, Sensitivity=92.579 Specificity=91.667). (E) ROC curve of LAPTM5, (AUC=94.808, cutoff value=12.983 Sensitivity=85.158 Specificity=94.444). (F) ROC curve of SERPINE1, AUC=76.272, cutoff value=12,646, Sensitivity=66.234 Specificity=75).
