

Comments to the Authors:

In this study, the authors aimed to assess Prevalence of food addiction using the Yale-C scale in overweight and obese children in Mexico. I have a number of minor and major comments.

- 1- Please mention to the global prevalence of food addiction in the introduction section before the prevalence of food addiction in Mexico.
- 2- Please mention "Food Addiction" with the abbreviation "FA" once in the text of the article. Then in the following times, the abbreviated form should be used in the text of the article. Also for the term YFAS in the same way in the text.
- 3- The word “significant” does not make sense in the discussion section of the article. Please rewrite this sentence.

“The coincidence of our results may be justified by the fact that we included a significant number of adolescents (67%)”.

- 4- In dissection section, line 219-222, grammatical errors seem to have occurred in this section, and the pronoun **his** needs to be corrected.

“In **his** initial study using the modified version of YFAS for a pediatric population, Gearhardt reported a 7.2% prevalence of FA. In contrast, in another study by Tompkins and collaborators (24) on overweight and obese adolescents, the reported prevalence was 30.7%.”

- 5- The English language should be improved to ensure that an international audience can clearly understand your text. Please review and revise the manuscript for grammatical mistakes.
