Background: Positional data have been used to capture physical, physiological and tactical factors in football. However, previous systematic reviews captured the tactical behaviours without considering the integration of the different performance dimensions. Thus, the aim of this article was to systematically review the published articles that encompass physical, physiological and tactical variables in football using positional data.

Methods and Materials: Following the Preferred Reporting Item for Systematic Reviews and Meta-analyses (PRISMA), a systematic search of relevant English-language articles was performed from earliest record to August 2021. The methodological quality of the studies was evaluated using the modified Downs and Black Quality Index (observational and cross-sectional studies) and the Physiotherapy Evidence Database (PEDro) scale (intervention studies). **Results** The literature search returned 982 articles (WoS = 495; PubMed = 232 and SportDiscus = 255). After screening, 26 full-text articles met the inclusion criteria and data extraction was conducted. All studies considered the integration of

physical/physiological and tactical variables in football using positional data ($n = 26$). Other dimensions were also reported, such as psychological and technical factors, however the results of these approaches were not the focus of the analysis ($n = 5$). Quasi-experimental approaches considered training sets ($n = 20$) and match contexts ($n = 6$). One study analysed both training and play insights. Small sided-games (SSG) were the most common training task formats in the reviewed studies, with only three articles addressing medium-sided (MSG) ($n = 1$) and large-sided games (LSG) ($n = 2$), respectively.

Conclusions: Among the current systematic review, the physical and physiological data can be integrated by player's movement speed, heart-rate based measures and perceived

exertion. Positional datasets can be computed by spatial movement variability/regularity, complex index, coordination/synchronization using intra-team and inter-team dyads, playing space. Futures researches should consider applying positional data in women's football environments and explore the representativeness of the MSG and LSG.

Abstract

Background: Positional data have been used to capture physical, physiological and tactical factors in football. However, previous systematic reviews captured the tactical behaviours without considering the integration of the different performance dimensions. Thus, the aim of this article was to systematically review the published articles that encompass physical, physiological and tactical variables in football using positional data.

Methods and Materials: Following the Preferred Reporting Item for Systematic Reviews and Meta-analyses (PRISMA), a systematic search of relevant English-language articles was performed from earliest record to August 2021. The methodological quality of the studies was evaluated using the modified Downs and Black Quality Index (observational and cross-sectional studies) and the Physiotherapy Evidence Database (PEDro) scale (intervention studies).

Results The literature search returned 982 articles (WoS = 495; PubMed = 232 and SportDiscus = 255). After screening, 26 full-text articles met the inclusion criteria and data extraction was conducted. All studies considered the integration of physical/physiological and tactical variables in football using positional data ($n = 26$). Other dimensions were also reported, such as psychological and technical factors, however the results of these approaches were not the focus of the analysis ($n = 5$). Quasi-experimental approaches considered training sets ($n = 20$) and match contexts ($n = 6$). One study analysed both training and play insights. Small sided-games (SSG) were the most common training task formats in the reviewed studies, with only three articles addressing medium-sided (MSG) ($n = 1$) and large-sided games (LSG) ($n = 2$), respectively.

Conclusions: Among the current systematic review, the physical and physiological data can be integrated by player's movement speed, heart-rate based measures and perceived exertion.

27 Positional datasets can be computed by spatial movement variability/regularity, complex index,
 28 coordination/synchronization using intra-team and inter-team dyads, playing space. Futures
 29 researches should consider applying positional data in women's football environments and explore
 30 the representativeness of the MSG and LSG.

31 **Keywords:** tracking systems, movement, complexity, training, match

1. Introduction

Football can be characterized as a complex and dynamical system where the players collect ecological information's to make decisions, allowing them to gather numerical and spatial advantageous with a goal-orientation through the phases of play (Duarte et al., 2012; Folgado et al., 2014; Hewitt et al., 2016). Hence, football players carried out intermittent movements to perform individual and collective tactical actions (Clemente et al., 2020; Duarte et al., 2012; Low et al., 2019). The tracking systems have been used to compute spatiotemporal measures and assess players' position during training and match activities (Lames et al., 2010; Marcelino et al., 2020; Pol et al., 2020). Positional data can be captured at different frequencies by tracking systems such as global navigation satellite systems (GNSS) or global positioning systems (GPS) (Beato et al., 2018; Rago et al., 2019; Teixeira et al., 2021), local radio-based local positioning (LPM) (Hoppe et al., 2018; Leser et al., 2011; Ogris et al., 2012) and computerized-video or optical-based tracking systems (Beato & Jamil, 2018; Castellano et al., 2014; Di Salvo & Marco, 2006). The players and ball positioning can be computed by Cartesian and Euclidian coordinates (xx, yy) giving contextualize the physical and physiological demands on the tactical behaviour (Carrilho et al., 2020; F. M. Clemente et al., 2013; Low et al., 2020; Memmert et al., 2017). However, some of the above mentioned tracking methods do not allow to gather information about the player-ball-goal position (Carrilho et al., 2020; Vidal-Codina et al., 2022), opponent-adaptive play strategy (Memmert, 2021; Ranjitha et al., 2020) and individual tactical behavior (Laakso et al., 2022; Reis & Almeida, 2020).

Furthermore, the tracking systems generate a large quantity and variety of data that can be used for performance analysis in football contexts (Rein & Memmert, 2016; Rojas-Valverde et al., 2019). It is important implementing multidisciplinary frameworks between sports science and

computer science based on big data methodology, using new computational procedures to extract, process and analyse data with practical applicability for training and match performance (Rico-González et al., 2021). However, most of the scientific production is based exclusively on physical and physiological performance without giving a contextual and behavioural significance to the players' movements (Teixeira et al., 2022). Moreover, performance analysis in football needs a multidimensional approach to capture the adaptive individual and collective behaviour (Carling et al., 2014; Gonçalves et al., 2019). These multifactorial phenomenon depends on a physical, tactical, and technical factors with a not each performance factor is not mutually exclusive of one another (Bradley & Ade, 2018; Paul et al., 2015).

Currently, a growing reviews and meta-analysis have been published on this research topic focusing on training and match insights (Low et al., 2020; Rago et al., 2020; Teixeira et al., 2021). However, reviewing articles have considered each performance factor independently, describing tactical behaviour separately from physical and physiological demands. Also, previous systematic reviews captured the tactical behaviours without considering the integration of the different performance dimensions (Coito et al., 2022; Ometto et al., 2018). To the best of our knowledge, no attempts have been made to review the state of art concerning that included integrative approaches to emphasize the positional data collected through tracking systems regarding physical, physiological and tactical variables. Thus, a lack of the absence of procedural standardization to apply positional data in an integrative approach (Teixeira et al., 2022). Thus, the aim of this study was to systematically review the published articles that integrate physical, physiological and tactical variables in football using positional data.

2. Methods

2.1. Literature Search strategy

The literature search strategy was registered at the International Platform of Registered Systematic Review and Meta-Analysis Protocols with the number 202270030 (doi: 10.37766/inplasy2022.7.0030). The protocol was designed in accordance with ‘The Preferred Reporting Items for Systematic Reviews and Meta-Analyses’ (PRISMA) guidelines and the ‘Population-Intervention-Comparators-Outcomes’ (PICOS) (Moher et al., 2009). The literature search was based on three databases: PubMed/Medline, Web of Science (WoS, including all Web of Science Core Collection: Citation Indexes), and SportDiscus. The studies were searched using a Boolean search phrase with specific keywords (Table 1).

[PLACE TABLE 1 HERE]

The literature search was accessed between April and May 2022 by an independently author (J.E.T), and checked by a second author (P.F.). Discrepancies between the authors in the study selection were solved with support a third reviewer (T.M.B). Double-check review is recommended in PRISMA guidelines (Moher et al., 2009). The literature search was limited to peer-reviewed articles and authors did not prioritize authors or journals.

2.2. Selection criteria

The selection criteria were conducted by the following PICOS approach: (1) *Population*: amateur, semi-professional and professional Football players (aged ≥ 10 years); (2) *Intervention*: integration of physical/physiological and tactical measures using spatiotemporal datasets; (3) *Comparison*: physical, physiological and tactical variables (4) *Outcomes*: tracking, positional and time-series

data; (5) *Study design*: original experimental and quasi-experimental trials (e.g., randomized controlled trial, cohort studies or cross-sectional studies).

On this basis, the inclusion criteria used for the article selection were: (1) original article focused on adult and youth football players of both sexes; (2) studies with screening procedures based on physical, physiological and tactical measures using tracking and positional data; (3) studies that used spatiotemporal to assess physical and physiological; (4) studies that used positional and tracking data to measures spatiotemporal and tactical variables through time-series; (3) other performance factors as psychophysiological, technical and contextual factors were not excluded from the present review only if both variables of interest (i.e. physical, physiological and tactical measures) were also part of the experimental design; (5) studies of human physical and physiological performance in Sport Science and as scope; (6) original article published in a peer-review journal; (7) full text available in English; (8) article reported sample and screening procedures (e.g. data collection, study design, instruments, and the outcomes).

Otherwise, the exclusion criteria were: (1) original articles individual and others team sports as football code population (e.g. Australian Football, Gaelic Football, Union and/or Seven Rugby); (2) studies that study that analysed none or only one of the target performance factors (i.e. physical/physiological or tactical measures); (3) studies which integrate several performance factors, but do not combine the two variables of interest even if one of them is integrated; (4) studies that measured physical and physiological using on field based test and laboratory test rather than tracking and positional data; (5) studies that included tactical variables using notational analysis and other methodological procedures that do not assess spatiotemporal and positional data through time-series; (6) others research areas and non-human participants; (7) articles with bad quality in the description of study sample and screening procedures (e.g. data collection, study

design, instruments, and the measures) according to PEDro and Downs and Black scales; (8) reviews, abstract/papers conference, surveys, opinion pieces, commentaries, books, periodicals, editorials, case studies, non-peer-reviewed text, masters and/or doctoral thesis.

2.3. Quality Assessment

The methodological quality was assessed using the modified Downs and Black Quality Index (cross-sectional studies) and the Physiotherapy Evidence Database (PEDro) scale (intervention studies) based on previous systematics reviews (Bujalance-Moreno et al., 2019, Rago et al., 2020). Quality Assessment was independently performed by two authors (J.E.T, P.F.) with subsequent inter-observer reliability analysis (Kappa index: 0.91; 95% IC: 0.90–0.92) (Table 3).

2.4. Study Coding and Data Extraction

3. The data extraction of the reviewed articles were organized into the following topics: (1) sampling characteristics by the study design, population, competitive level, sample (N), sex, age, expertise level and quality score (Table 3); (2) summary of performance dimension, measures, measurement, thresholds and/or metric formula in the reviewed articles; references and ‘further reading’ reports the original studies where the methodology of the included articles were based (Table 4); (3) methodological approaches of the reviewed studies by reporting the study purpose, experimental approach, methodological procedures, data collection, statistical and mathematical analysis (Table 5). Data were collected as previously described in ‘The Cochrane Data Extraction Template for Included Studies’ using a Microsoft Excel sheet (Microsoft Corporation, Readmon, WA, USA (Synnot et al., 2020)).

Results

3.1. Search Results and Study Selection

Table 2 showed the search results in each databases according to keywords organized by PICOS approach. A total of 982 titles were collected through three database searches (WoS = 495; PubMed = 232 and SportDiscus = 255).

[PLACE TABLE 2 HERE]

After applying the selection criteria, 153 full-text articles were assessed for eligibility, having selected 26 articles for final revision. Figure 1 showed the search results using PRISMA flow diagram with screening procedures and search results.

[PLACE FIGURE 1 HERE]

3.2. Participant Characteristics

The reviewed articles were published between 2000 and 2022. Studies samples were ranged between 8–148 participants with an observational, prospective and cross-sectional design ($n = 8$) and randomized controlled trial ($n = 18$). Twenty-three articles were focused on adult football players and seven on youth population.. All articles were performed on male football players, specifically in elite ($n = 2$), professional ($n = 8$), high-level ($n = 1$), national level ($n = 2$), amateur ($n = 2$) and volunteer ($n = 1$) contexts. A total of 538 football players were analysed in this systematic review. Age and expertise level in the included studies was 16.81 ± 1.63 and 4.2 ± 3.83 years, respectively. Table 3 provides the sampling characteristics of the reviewed studies.

[PLACE TABLE 3 HERE]

3.3. Quality Assessment

In the evaluation of methodological quality, the mean quality score and standard deviation of all the included studies was 4.92, ranging between 3 (lowest quality) to 7 (highest quality) points of maximum score of 8 in the qualitative assessment (Table 3).

3.4. Main Findings

Table 4 presented the data extraction of the reviewed studies. Concerning the physical and physiological datasets, the measures considered were external load (i.e., movement speed) and internal load (i.e., heart rate-based methods), specifically: (i) total distance covered ($n = 11$), (ii) distance covered at different speed zones ($n = 13$), (iii) game pace or average speed ($n = 3$), (iv) accelerations and decelerations ($n = 3$), (v) locomotive-based ratios (e.g., ratio between the distance covered at different intensities and distance) ($n = 1$), (vi) exertion-based indexes (i.e., exertion index per minute, ratings of perceived exertion) ($n = 1$) and (vii) heart rate-based methods (i.e., $\%HR_{max}$, $TRIMP_{MOD}$) ($n = 3$). Otherwise, positional and tactical variables reported in the included studies was based on the following independent variables: (i) possession ball ($n = 1$), (ii) spatial exploration indexes ($n = 6$), (iii) LPW ratio ($n = 1$), (iv) stretch indexes ($n = 2$), (v) multiscale entropy ($n = 1$), (vi) synchronization indexes (i.e., longitudinal and lateral directions) ($n = 10$), (v) intra-team and opponent's dyads ($n = 3$), (vi) dispersion and contraction indexes (i.e., length, width and speed) ($n = 4$), (vii) playing space and effectiveness (i.e., effective playing space, longitudinal distance between GK and the closest defender ($n = 3$), (viii) player's variability, regularity and coordination ($n = 10$) (i.e., entropy, dynamic overlap, near-in-phase and near-anti-phase coordination, regularity zones occupied), (ix) team centroid ($n = 2$).

Table 5 showed the study purpose, game format, experimental approach, methodological procedures, data collection, statistical and mathematical analysis of the included studies in this

review (Table 4). The data organization respected the main purposes of this systematic review, specifically the integration of physical/physiological and tactical variables in football using positional data ($n = 26$). Other dimensions were also reported, such as psychological and technical factors, however the results of these approaches were not the focus of the analysis ($n = 5$). Quasi-experimental approaches considered training sets ($n = 20$) and match contexts ($n = 6$). One study analysed both training and play insights. Small sided-games (SSG) were the most common training task formats in the reviewed studies, with only three articles addressing medium-sided (MSG) ($n = 1$) and large-sided games (LSG) ($n = 2$), respectively. Regarding the methodological procedures, Matlab® routines (Math-Works, Inc., Massachusetts, USA) were used by all authors for processing raw data (xx, yy) ($n = 26$). All studies applied Butterworth low pass filter at frequency sampling ranged between 3–5 Hz using 10–20 windows and 1000–3000 points per data collect. Match analysis software were applied for to extract technical variables into three studies, specifically the LongoMatch® software ($n = 1$), Match Analysis Camera Systems® ($n = 1$) and Lince software ($n = 1$). Data collection was based on GPS ($n = 15$), LPM ($n = 2$) and optical-based tracking systems ($n = 5$) ranging from 5 to 15 Hz. Also, internal training load measures was collected by 1 Hz short-range radio telemetry ($n = 2$) and CR 10-scale ($n = 1$). A study used portable optical timing system to measure neuromuscular performance (i.e., countermovement jump, CMJ).

A null hypothesis statistical test (NHST) and magnitude-based inferences (MBI) in seven studies ($n = 7$) and five studies ($n = 5$), respectively. The statistical and mathematical analysis performed in the reviewed reports were the approximate entropy (ApEn) ($n = 7$), Boltzmann–Gibbs–Shannon entropy measure ($n = 7$), Coefficient of variation (CV) ($n = 7$), dynamic overlap ($\langle qd(t) \rangle$) ($n = 7$), effect sized Cohen d ($n = 7$), effect sized eta-squared (η_p^2) ($n = 7$), hilbert

transform ($n = 7$), intraclass correlation (ICC) ($n = 7$), smallest worthwhile changes (SWC) ($n =$
 7), standard error of measurement (SEM) ($n = 7$), standardized (Cohen) differences ($n = 7$),
 structural coefficients (SC) ($n = 7$), and trapping strength ($n = 7$).

[PLACE TABLE 5 HERE]

4. Discussion

The aim of this study was to systematically review the published articles that integrate physical, physiological and tactical variables in football using positional data. Earliest, the physical and physiological data was analysed by the player's movement speed, heart-rate based measures and perceived exertion. Otherwise, positional datasets was computed by individual and team collective behaviour expressed using spatio-temporal features such as spatial variability or regularity of the player's movements, complex index, coordination/synchronization using intra-team and inter-team dyads, playing space.

Positional datasets allows a more ecological approach to individual physical and physiological demands, if the data interpretation considers the contextual factors and collective behaviour through a tactical analysis (Marcelino et al., 2020; Teixeira et al., 2022; Teixeira et al., 2021). As well, several authors have emphasized the need to recklessness the one-dimensional research. It is important to apply methodologies based on integrative approaches that analyse the interdependence between technical factors, key tactical/performance indicators, collective behaviour and match-related contextual factors (Teixeira et al., 2022). Therefore, an integrative approach was extended in 8 articles by adding psychophysiological and technical outcomes (Bradley & Ade, 2018; Paul et al., 2015). Considering the multifactoriality of performance in team sports as football, it is also important to consider the influence of psychological variables on the control of physical capacities, pacing behaviour, decision-making, self-regulation, and effort perception (Branquinho et al., 2020, 2021; Ferraz et al., 2022). Also, the bringing together of observational methodologies should be considered when positional data is to be made meaningful with skilled and technical aspects (Anguera & Mendo, 2013; Preciado et al., 2019; Sarmiento et al., 2018).

Moreover, the reviewed quasi-experimental approaches considered training sets and match contexts. Small sided-games (SSG) were the most common training task formats in the reviewed studies, with only three articles addressing medium-sided (MSG) and large-sided games (LSG) (Machado et al., 2020; Folgado et al., 2018; Gonçalves et al., 2017; Jara et al., 2019; Nieto et al., 2022; Praça et al., 2016), respectively. Thus, the SSG formats have been further explored in the literature, mainly through the 5- and 6-sided game format. Indeed, these SSG-based formats was previous reported as an useful tool to promote into significant variations in the training load, and in the likely improvement of the different domains of soccer training (i.e., physiological, technical, and tactical dimensions) (Branquinho & Marques, 2021; Clemente et al., 2021). Also, SSG and conditioned games (SSCG) are an excellent form to enhance acquisition of motor efficiency and decision-making skills (Davids et al., 2013). A widespread research gap remains unexplored in MSG and LSG formats, as well as their relationship with formal game formats (i.e., 7-, 8-, 9- and 11-sided formats) (Baptista et al., 2020; Coutinho et al., 2019, 2020; Ferraz et al., 2020; Figueira et al., 2018; Gonçalves et al., 2017; Sampaio et al., 2014).

Regarding the methodological procedures, Matlab® routines (Math-Works, Inc., Massachusetts, USA) were applied to process raw data (xx, yy) ($n = 26$), transforming data points in the Universal Transverse Mercator (UTM) coordinate system (Folgado et al., 2014; Sampaio & Maças, 2012). The most used correction guidelines to reduce tracking signal noise was a 3 Hz Butterworth low pass filter by applying a non-linear logarithms using 20 windows of 3000 points per data collect (Coutinho et al., 2019, 2020; Figueira et al., 2018; Folgado et al., 2015, 2019; Gonçalves et al., 2017, 2018). Other studies used smaller data windows such as 1500 data sets and a sampling frequency for signal correction (i.e., 5Hz) (Baptista et al., 2020). Nevertheless, the sampling frequency and datasets is highly dependent on the type of non-linear method to be used,

and the use of higher time-series lengths can increase the consistency of the positional data (Baptista et al., 2020; Richman & Moorman, 2000; Yentes et al., 2013). Approximate entropy (ApEn) was the most applied non-linear method for measuring the spatial movement variability/regularity (Baptista et al., 2020; Coutinho et al., 2019, 2020; Ferraz et al., 2020; Figueira et al., 2018; Gonçalves et al., 2017; Sampaio et al., 2014). Also, stretch index can be based on the ApEn or distance, being the most reported complex index in the reviewed literature (Coutinho et al., 2019; Olthof et al., 2018; Praça et al., 2021). Indeed, the entropy has been extensively reported as outstanding informational parameter to describe the variability and predictability of the players' movement (Teixeira et al., 2022). Hilbert transform was the most frequent method, by computing the longitudinal and lateral directions through in- and anti-phase (Coutinho et al., 2019, 2020;; Fernandes et al., 2010; Figueira et al., 2018; Folgado et al., 2015, 2019; Gonçalves et al., 2017, 2018). Total surface area or playing space (m²) can be provided through trigonometry using the smallest convex hull and/or polygonal area delimited by the peripheral players (Coutinho et al., 2017; Folgado et al., 2019; Olthof et al., 2018). Recently, Teixeira et al. (2022) reported what remains to be explored correlation matrixes, clustering methods and fractality patterns. This review confirms this and opens up the possibility of exploring these metrics by integrating physical and physiological demands with individual and collective behaviour.

Match analysis software were applied in reviewed three studies for notational analysis to extract technical variables, specifically the LongoMatch[®] software, Match Analysis Camera Systems[®] (Gonçalves et al., 2018) and Lince software (Canton et al., 2021; Ric et al., 2016). Further tactical variables was applied in the reviewed studies using other methodological approaches (i.e., observational and notational analysis) such as metrics based on ball possession,

279 team networks and tactical actions classifications. Technical outcomes were mainly based on
 280 individual actions and skills characterized in quantity and success (i.e., successful passes, dribbles
 281 and shots) (Coutinho et al., 2020, 2022a; 2022b; 2022c; Folgado et al., 2019; Olthof et al., 2018;
 282 Ric et al., 2017). Data collection was based on GPS, LPM and optical-based tracking systems
 283 ranging from 5 to 18 Hz. The first studies were mainly based on 5 Hz GPS (SPI-Pro X II, GPS
 284 ports, Canberra, ACT, and Australia), however the use of sampling frequency at 5Hz must consider
 285 some limitations in the measurement of non-linear and high-intensity paths (Portas et al., 2010;
 286 Teixeira et al., 2021). Authors should prioritise tracking devices with sampling frequencies above
 287 10 Hz shape with an accelerometer (Gómez-Carmona et al., 2020; Rico-González et al., 2020).
 288 The latest GPS devices already recommend a sampling frequency of 10-18Hz, specifically 10 Hz
 289 GPS units (WIMU PRO, RealTrack Systems, Almeria, Spain) (Canton et al., 2021; Machado et
 290 al., 2022), 10 Hz GPS (S5, Catapult Innovations, Australia) (Folgado et al., 2019; Nieto et al.,
 291 2022), 10 Hz GPS (Polar, Team Pro, Kempele, Finland) (Praça et al., 2021), 15Hz GPS (SPIPRO,
 292 GPSports, Canberra, ACT, Australia) (Coutinho et al., 2017; Praça et al., 2016; Ric et al., 2016)
 293 and 18.18 Hz GPS (GPEXE GK, Exelio SRL, Udine, Italy) (Jara et al., 2019). LPM devices and
 294 semiautomatic video tracking system used in the surveyed studies were the Prozone® (ProZone
 295 Holdings Ltd, UK) (Folgado et al., 2015) and the Inmotio Object Tracking® (BV., Amsterdam, the
 296 Netherlands) (Olthof et al., 2018). The integration of the different tracking systems can be further
 297 explored from an integrative perspective (Buchheit et al., 2014; Linke et al., 2018). Also, the
 298 relationship between objective (i.e., tracking systems) and subjective (i.e., observational/notational
 299 analysis) measures should be explored in future integrative approaches, in order to make the
 300 integration of technical and tactical factors more effective (Teixeira et al., 2021b). Likewise,
 301 internal training load was collected by heart-rate-based measures and perceived exertion. Although

some limitations have been reported in some studies, the perceived exertion and heart-rate maintains its applicability for elite and sub-elite football contexts, and is lower cost and more easily implemented (Achten & Jeukendrup, 2003; Teixeira et al., 2022; Teixeira, Forte, et al., 2021b). A study used portable optical timing system to measure neuromuscular performance (i.e., countermovement jump, CMJ). The field-based tests in football becomes more effective when continuous control (i.e. monitoring) is integrated into the assessment (Clemente et al., 2022; Gomez-Carmona et al., 2020).

A null hypothesis statistical test (NHST) and magnitude-based inferences (MBI) in seven studies and five studies, respectively. Some authors used joint approaches for their data handling, as well as statistical analysis such as coefficient of variation (CV) ($n = 7$), effect sized (ES) and smallest worthwhile changes (SWC) (Bernards et al., 2017; Flanagan, 2013). The application of the two statistical approaches makes it more difficult to compare results of the availed studies, and future studies should further analyse the potential overvaluation and bias of the study findings (Foster et al., 2017; Welsh & Knight, 2015). Bringing NHST and MBI approaches together may be a valid approach to avoid overestimating outcomes (Welsh & Knight, 2015).

The current systematic review has some limitations should be consider. First, the interpretation of the studies was only qualitative, not considering meta-analysis. Second, the fact that only studies that integrated the physical, physiological and tactical variables and not just one dimension. For this reason, other information about physiological and behavioural data may have been absent (Duarte et al., 2013; Folgado et al., 2014; Vilar et al., 2014). Although this was made objective in the inclusion and exclusion criteria, future systematic reviews should clarify which studies used both one-dimensional and integrative approach. As practical applications and futures researches, there are some future topics that could be explored specifically: (i) the development of

friendly-user interfaces, in order to disseminate positional data until now almost exclusively to Matlab® routines processing (Math-Works, Inc., Massachusetts, USA); (ii) developing tracking and wearables devices which enable real-time feedback to increase the practical applicability and decision making of football players and coaching staff; (iii) applying advanced data analytics and big data-based methods using artificial intelligence (AI), machine learning (ML) and deep learning to compute automatically physiological and positional data; (iv) manipulating task constraints in MSG, LSG and different game-formats can still be better exploited; woman's football is still not analysed using physical, physiological and tactical integration.

5. Conclusions

Among the current systematic review, the physical and physiological data can be integrated by player's movement speed, heart-rate based measures and perceived exertion. Positional datasets can be computed by spatial movement variability/regularity, complex index, coordination/synchronization using intra-team and inter-team dyads, playing space. Futures researches should consider applying positional data in women's football environments and explore the representativeness of the MSG and LSG.

Table 4(on next page)

Summary of performance dimensions, measures, measurements and their thresholds/metric formulas in the included articles

1 Table 4 – Summary of performance dimensions, measures, measurements and their thresholds/metric formulas in the included articles.

Dimension	Measure	Measurement	Description, thresholds and/or metric formula	Reference	Further reading
Physical/Physiological data	External load	TD (m)	Distance covered at high to very high (Higher Ratio: above 16 km·h ⁻¹), moderate (Moderate Ratio: 10.0–15.9 km·h ⁻¹) and low intensity (Lower Ratio: 7.0–9.9 km·h ⁻¹) with distance covered at very low intensities (0.0–6.9 km·h ⁻¹)	(Canton et al., 2021; Coutinho, Gonçalves, Santos, et al., 2019; Coutinho, Gonçalves, Travassos, et al., 2019)	(Abade et al., 2014; P. S. Bradley & Ade, 2018; Hodgson et al., 2014)
			0.0–3.5 km·h ⁻¹ (walking); 3.6–14.3 km·h ⁻¹ (jogging); 14.4–19.7 km·h ⁻¹ (running); and >19.8 km·h ⁻¹ (sprinting)	(Coutts & Duffield, 2010; Ferraz et al., 2020; Figueira et al., 2018; Folgado et al., 2015, 2018; B. Gonçalves et al., 2017; B. Gonçalves, Coutinho, et al., 2018; Ric, Hristovski, et al., 2016; Ric et al., 2017)	(Duarte, Araújo, Folgado, et al., 2013; Folgado, Duarte, et al., 2014; Giménez et al., 2018; B. Gonçalves et al., 2017)
			Zone 1 (0–6.9 km·h ⁻¹); zone 2 (7–9.9 km·h ⁻¹); zone 3 (10–12.9 km·h ⁻¹); zone 4 (13–15.9 km·h ⁻¹); zone 5 (16–17.9 km·h ⁻¹) and zone 6 (≥18 km·h ⁻¹).	(Sampaio et al., 2014)	(Hill-Haas et al., 2008)
		High Speed (km·h ⁻¹)	(distance covered in the high ratio/distance covered while walking)*100	(Coutinho, Gonçalves, Santos, et al., 2019; Coutinho, Gonçalves, Travassos, et al., 2019)	(Abade et al., 2014; B. Gonçalves, Folgado, et al., 2018)
			Distance covered at high intensity (≥ 19.8 km·h ⁻¹) and number of sprints (frequency of displacements ≥ 25.2 km·h ⁻¹)	(Olthof et al., 2018)	(Abt & Lovell, 2009; Goto et al., 2015)
			Distance covered at high-speed at three speed zones (14.40–19.79 km·h ⁻¹ , 19.80–22.99 km·h ⁻¹ , higher than 23.00 km·h ⁻¹) and number of sprints (frequency of displacements ≥ 23.00 km·h ⁻¹)	(Praça et al., 2021)	(Mallo et al., 2015; Praça et al., 2020)
	Internal load	Game Pace or Average Speed (km·h ⁻¹ or CV)	Players' average speed displacement, expressed as meters or CV.	(Canton et al., 2021; Coutinho, Gonçalves, Santos, et al., 2019; Coutinho, Gonçalves, Travassos, et al., 2019)	(Ferraz et al., 2017, 2018; B. Gonçalves et al., 2019)
		ACC/DEC (m·s ⁻²)	ACC: 0.5–3.0 m·s ⁻² ; DEC: > -3.0 0 m·s ⁻²	(Coutinho et al., 2017)	(Dalen et al., 2016; Russell et al., 2016)
		HR _{max}	Percentage of HR _{max} and classified into time spend in following zones of intensity: Zone 1 (<75% HR _{max}), Zone 2 (75–84.9% HR _{max}), Zone 3 (85–89.9% HR _{max}), and Zone 4 (≥90% HR _{max}).	(Folgado et al., 2018; J. E. Sampaio et al., 2014)	(Abt & Lovell, 2009; Gore, 2000)
		Average HR	Average beats per minute (BPM)	(B. Gonçalves et al., 2017)	ND
Positional data	Spatial and temporal features	TRIMP _{MOD}	Total TRIMP _{MOD} result is equal to the sum of all HR zones: zone 1 (65–71% HR _{max})*1.25; zone 2 (72–78% HR _{max})*1.71; zone 3 (79–85% HR _{max})*2.54; zone 4 (86–92% HR _{max})*3.61; and zone 5 (93–100% HR _{max})*5.16	(Folgado et al., 2018)	(Campos-Vazquez et al., 2015; Los Arcos et al., 2014; Stagno et al., 2007)
		CV	Magnitude of the variability in the distance between players', expressed by the coefficient of variation CV (%)	(Coutinho, Gonçalves, Travassos, et al., 2019; Coutinho et al., 2020; Figueira et al., 2018; B. Gonçalves et al., 2017)	(Frencken et al., 2012; Harbourne & Stergiou, 2009; Seifert et al., 2013; Travassos et al., 2014)
		ApEn	Ranged 0 to 2, in which lower values correspond to more repeatable patterns). The imputed values used to compute were 2 to vector length (m) and 0.2*std to the tolerance (r).	(Baptista et al., 2020; Coutinho et al., 2020; Coutinho et al., 2019; Ferraz et al., 2020; Figueira et al., 2018; Gonçalves et al., 2017; Sampaio et al., 2014)	(Duarte, Araújo, Davids, et al., 2012; B. Gonçalves et al., 2016; Gréhaigne et al., 1997; Pincus, 1991; Preatoni et al., 2010; Richman & Moorman, 2000; Seifert et al., 2013; Silva, Duarte, et al., 2016; Stergiou et al., 2004; Yentes et al., 2013)
		Boltzmann–Gibbs–Shannon entropy	Probabilities of configurations were calculated as limit (large N) relative frequencies for stationary distributions: $pi = ni/N$, where ni and N is the frequency and total number of the configuration respectively.	(Ric, Hristovski, et al., 2016)	(Balescu, 1975)
	Complex Index	MSE SamEn	SampEn algorithm to compute entropy values at a range of different timescales, calculating the area under the MSE curves were calculated and presented as the complexity index.	(Canton et al., 2021)	(Busa & van Emmerik, 2016; M. Costa et al., 2005)
		SEI	Width and length displacements. Distance from each positioning time series to the mean position and then computing the mean value from all the obtained distances.	(Canton et al., 2021; Figueira et al., 2018; B. Gonçalves et al., 2017; Praça et al., 2021)	(Arede et al., 2021; F. M. Clemente, Owen, Mustapha, et al., 2018; F. M. Clemente, Owen, Serra-Olivares, et al., 2018; Travassos et al., 2014)

			Stretch Index (meters or ApEn)	Men of the distances between each player and the geometric centre of the team.	(Coutinho, Gonçalves, Travassos, et al., 2019; Olthof et al., 2018; Praça et al., 2021)	(Bourbousson et al., 2010; F. M. Clemente et al., 2013; F. M. Clemente, Owen, Serra-Olivares, et al., 2018; Duarte, Araújo, Folgado, et al., 2013; Lames et al., 2010; Travassos et al., 2014)
			Dynamic overlap <qd(t)>	Average cosine auto-similarity of the overlap between configurations with increasing time lag: $\langle q_d(t) \rangle = (1 - q_{stat})t^\alpha + q_{stat}$		
			Trapping strength	Probability of remaining inside the same attractor that is a conditional probability of a configuration being subsequently repeated. The larger (lower) the trapping strength, the smaller (larger) is the overall behavioural flexibility.	(Ric, Hristovski, et al., 2016)	(Hristovski et al., 2013; Saxton, 1996)
			Voronoi algorithms	Voronoi algorithms allow to compute a diagram represented by spatial cells for individual area (m ²), among each one associated with the position of one player in the field.	(Baptista et al., 2020)	(Fonseca et al., 2012)
	Coordination/synchronization using intra-team dyads		Relative phase (Hilbert transform)	Longitudinal and lateral directions reported using near-inphase synchronization of each dyad was quantified by the percentage of time spent between −30° to 30° bin (near-in-phase mode of coordination).	(Coutinho et al., 2020; Coutinho, Gonçalves, Santos, et al., 2019; Fernandes et al., 2010; Figueira et al., 2018; Folgado et al., 2015, 2019; B. Gonçalves, Coutinho, et al., 2018; B. Gonçalves et al., 2017)	(Duarte, Araújo, Freire, et al., 2012; Duarte, Araújo, Davids, et al., 2012; Duarte, Araújo, Correia, et al., 2013; Folgado, Duarte, et al., 2014; Folgado, Lemmink, et al., 2014a; B. Gonçalves et al., 2019; McGarry et al., 2002; Palut & Zanone, 2005; J. Sampaio & Vitor, 2012; Silva, Chung, et al., 2016; Travassos et al., 2011a, 2011b, 2013)
			Speed synchronisation	0.0–3.5 km·h ^{−1} (low intensity); 3.6–14.3 km·h ^{−1} (moderate intensity); 14.4–19.7 km·h ^{−1} (high intensity); and >19.8 km·h ^{−1} (very high intensity).	(Folgado et al., 2018; B. Gonçalves, Coutinho, et al., 2018)	(Folgado, Duarte, et al., 2014; Folgado, Lemmink, et al., 2014a)
			Distance Player–Teammate	Interpersonal distance between each pair of players, both with teammates and opponents:		
	Coordination/synchronization using inter-team dyads		Distance Player–Opponent	$D(a_{x(t)y(t)}, b_{x(t)y(t)}) = \sqrt{(a_{x(t)y(t)})^2 + (a_{x(t)y(t)})^2}$ Where D is the distance, a is the player, x and y are the coordinates, and t is the time, and b is the teammate or opponent.	(Ferraz et al., 2020; Olthof et al., 2018; Ric et al., 2017; J. E. Sampaio et al., 2014)	(B. V. Gonçalves et al., 2014; Low et al., 2020; Silva, Vilar, et al., 2016)
			Distance from the target	Distance from the target according to ten categories: >37.45 m; 32.1 ± 37.45 m; 36.75 ± 32.1 m; 21.4 ± 26.75 m; 16.05 ± 21.4 m; 10.7 ± 16.05 m; 5.35 ± 10.7 m; 0 ± 5.35 m.	(Ric et al., 2017)	(Duarte, Araújo, Davids, et al., 2012)
	Playing Space		Total surface area or team effective playing space (m ²)	Smallest convex hull, that is the smallest polygonal area that it is delimited by the peripheral players	(Coutinho et al., 2017; Folgado et al., 2019; Olthof et al., 2018)	(Duarte, Araújo, Folgado, et al., 2013; Folgado, Lemmink, et al., 2014a; Mendes et al., 2007; Ric, Torrents, et al., 2016; Russell et al., 2016; J. Sampaio & Vitor, 2012)
			Ellipses: SEA and PEA areas	Spatial analysis for a set of points in a two-dimensional space, which boundaries will enclose about the 100(1 − α) % of the observations or set of points. $\bar{x} = \frac{1}{n} \sum_{i=0}^n x_i, \bar{y} = \frac{1}{n} \sum_{i=1}^n y_i$	(Jara et al., 2019)	(Batshchelet, 1981; Lefever, 1926; Yuill, 1971)
			Team’s width and length			
			Team’s speed contraction dispersion	Longitudinal position of team geometrical center (x axis) and lateral position of team geometrical center (y axis), expressed as meters, CV and length-per-width (LPW) ratio per team.	(Baptista et al., 2020; Canton et al., 2021; Coutinho et al., 2017; B. Gonçalves et al., 2017; Praça et al., 2021)	(Duarte, Araújo, Folgado, et al., 2013; Folgado, Lemmink, et al., 2014a; Frencken et al., 2011; Mendes et al., 2007; Ric, Torrents, et al., 2016)
Other dimensions	Technical variables	Individual actions		Successful Passes (%), Successful Dribbles (%), Shots on Target (%), Goals (%)	(Coutinho et al., 2020)	(Liu et al., 2016; O’Donoghue, 2009; Santos et al., 2018)
			Passes, dribbles and shots	Distance covered at different intensities while dribbling; number of completed passes; completed passes distance; shots distance to the goal; distance between the attacker the closest defender when shooting.	(Folgado et al., 2019; Olthof et al., 2018)	(Rampinini et al., 2009)
				The total passes performed with successful reception by a teammate, as well as turnovers (losing possession of the ball), goals scored and relative frequencies of players’ passing interactions.	(Ric et al., 2017)	(M. Costa et al., 2005)

		Transition probabilities were calculated dividing the number of each player's passes to his teammates, turnovers and goals by the total number of player interactions.			
Tactical variables	Ball Possession	Offensive/Defensive Phases	Duration of possession, team width, team length and their ratio (LPWR), as well as their coefficient of variation	(Canton et al., 2021; Olthof et al., 2018; Ric, Hristovski, et al., 2016)	(Collet, 2013; I. T. da Costa et al., 2011; Gabin et al., 2012)
	Network	Dyad Nodes	Relative phase analysis was also divided according to each dyad average speed, using the previously presented movement speed categories. Three levels – for the whole team; for dyads with similar synchronisation tendencies; and for each dyad.	(Folgado et al., 2015; Ric et al., 2017)	(McGarry et al., 2002; Travassos et al., 2011a, 2013)
	Tactical actions	Patterns/Categories	Tactical actions classified as tens categories: penetration, offensive coverage, depth mobility, width and length, offensive unity, delay, defensive coverage, balance, concentration, defensive unity.	(Ric et al., 2017)	(M. Costa et al., 2005)
Psychophysiological variables	Perceived Exertion	RPE (a.u.)	Players' psychological states at the beginning and the final of both conditions using CR10-scale (0 to 10 arbitrary units).	(Coutinho et al., 2017)	(Lee et al., 1991)
		Exertion index	Wisbey's formula: players' instantaneous speed, speed over 10 s and speed over 60 s.	(Folgado et al., 2015)	(Wisbey et al., 2010)

Abbreviations: <qd(t)> – Dynamic overlap; ACC/DEC – Accelerations and decelerations; ApEn – Approximate entropy; BPM – Average beats per minute; CR-10 – Borg CR10 scale; CV – Coefficient of variation; D – Distance; HR – Heart Rate; HR_{max} – maximum Heart Rate; LPWR – Team width, team length and their ratio or LPW – length-per-width ratio per team; MSE – Multiscale Entropy; PEA – Prediction Ellipse; RPE – Ratings of Perceived Exertion; SamEn – Sample Entropy; SEA – Standard Ellipse; SEI – Spatial exploration index; TD – Total distance; TRIMP – Training Impulse; TRIMP_{MOD} – modified Training Impulse.

Methodological approaches of included articles

Table 5 – Methodological approaches of included articles.

Referente (year)	Study Purpose	Experimental Approach						Methodological procedures	Data Collection (Device specification)	Statistical and mathematical analysis
		Match-play	Training set	Game format	Physical/Physiological	Positional/Tactical	Other dimensions			
Baptista et al. (2020)	Identified the effects of playing formations on tactical behaviour and external workload during SSG.	✗	SSG	GK + 7 vs 7 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Non-differential 5Hz GPS (ND)	Cohen' <i>d</i> SWC MBI ApEn Voronoi algorithm
Canton et al. (2021)	Identified how positioning the goals in diagonal configurations on the pitch modifies the external training load and the tactical behaviour during SSG.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA) Lince software® (Gabin et al., 2012),	10 Hz GPS units (WIMU PRO, RealTrack Systems, Almeria, Spain)	Cohen' <i>d</i> SWC MBI NHST
Coutinho et al. (2017)	Examined the effects of mental fatigue and additional corridor and pitch sector lines on players' physical and tactical performances during SSG.	✗	SSG	GK + 6 vs 6 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	CR10-scale (RPE) Portable optical timing system (Optojump, Microgate, Bolzano, Italy) 15Hz GPS (SPIPRO, GPSports, Canberra, ACT, Australia)	Cohen' <i>d</i> SWC NHST
Coutinho et al. (2019)	Identified the effects of adding spatial references during SSG on players' tactical and physical performance.	✗	SSG	GK + 6 vs 6 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	CV ApEn MBI NHST
Coutinho et al. (2019)	Identified the effects of different pitch configurations on players' positional and physical performance.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	CV ApEn MBI NHST
Coutinho et al. (2020)	Compared players' performances when manipulating the external markings of the pitch during SSG.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia) Digital video camera (Sony NV-GS230)	CV ApEn MBI NHST
Coutinho et al. (2022)	Explored how the number of allowed ball touches per player possession affected the performance of different age groups during SSG.	✗	SSG	GK + 6 vs 6 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	Cohen' <i>d</i> SWC NHST Hilbert transform
Coutinho et al. (2022)	Aimed to identify the effects of playing with additional individual, collective or individual-collective variability on players' performance during SSG.	✗	SSG	GK + 6 vs 6 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	Cohen' <i>d</i> NHST Hilbert transform
Coutinho et al. (2022)	Explored how manipulating the colour of training vests affects footballers' individual and collective performance during SSG.	✗	SSG	GK + 6 vs 6 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	Cohen' <i>d</i> NHST Hilbert transform
Ferraz et al. (2020)	Identified how the manipulation of knowledge regarding a training task duration constrains the pacing and tactical behaviour in SSG.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✓	ND	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	ApEn MBI
Figueira et al. (2018)	Compared footballers' performances when playing with teammates and opponents from the same or different age groups	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	CV ApEn MBI
Folgado et al. (2015)	Examined the physical and tactical performances under congested and non-congested fixture periods	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Semiautomatic tracking system (Prozone®, ProZone Holdings Ltd, UK).	CHAID Cohen' <i>d</i> NHST Hilbert transform
Folgado et al. (2018)	Identified changes in tactical, physical and physiological performances in LSG during the preseason.	✗	LSG	GK + 8 vs. 8 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	NHST Cohen' <i>d</i>
Folgado et al. (2019)	Compared players' performance during two SSG with different pitch orientation (i.e., 40x30m vs 30x40m).	✗	SSG	GK + 4 vs 4 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	10 Hz GPS (MinimaxX S5, Catapult Innovations, Australia). Digital Video Camera (Canon PowerShot SX720 HS, Canon Inc.	ICC SEM Cohen' <i>d</i> SWC

									Tokyo, Japan),	MBI
Gonçalves et al. (2014)	Identified differences in time-motion, modified training impulse, body load and movement behaviour between defenders, midfielders and forwards, during an 11-a-side simulated football game.	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia) 1 Hz short-range radio telemetry (Polar Team Sports System, Polar Electro Oy, Finland)	Hilbert transform ApEn NHST
Gonçalves et al. (2017)	Identified how pitch area restrictions affect the players' tactical behavior, physical, and physiological performances during LSG.	✗	LSG	GK + 9 vs. 9 + GK GK + 10 vs. 10 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia) 1 Hz short-range radio telemetry (Polar Team Sports System, Polar Electro Oy, Finland)	Hilbert transform CV ApEn Cohen' <i>d</i> SWC MBI
Gonçalves et al. (2018)	Examined the changes in the players' speed synchronization and physical performance between the first and the second half (15- min time). Explored the match-to-match variation of players' speed synchronization performance.	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Match Analysis Camera System®.	Hilbert transform CV Cohen' <i>d</i> SWC MBI
Jara et al. (2019)	Analyzed how the modification of the pitch size in SSGs affects the GK's physical demands.	✗	SSG MSG LSG	ND	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	18.18 Hz GPS (GPEXE GK, Exelio SRL, Udine, Italy)	Cohen' <i>d</i> MBI NHST
Machado et al. (2022)	Investigated how different strategies of task constraint manipulation impact physical and tactical demands in small-sided and conditioned games (SSCG)	✗	SSG	GK + 4 vs 4 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA) and SPRO™ (RealTrack System, Almeria, Spain)	10 Hz GPS and inertial devices (WIMU ProTM and GPS, RealTrack System, Almeria, Spain)	Effect size (ND) NHST
Nieto et al. (2022)	Described the effects on player's collective behaviour and physical response in three different pitch lengths (100, 75 and 50 m) keeping the width constant (60 m)	✗	LSG	GK + 11 vs 11 + GK	✓	✓	✗	Microsoft Excel Visual Basic for Applications (VBA) (Microsoft, Redmond, WA, USA)	10 Hz GPS (MinimaxX S5, Catapult Innovations)	Cohen' <i>d</i> MBI NHST SampEn
Olthof et al. (2018)	Investigated SSGs with a traditional small pitch and a match-derived relative pitch area in youth elite soccer players.	✓	SSG	GK + 4 vs 4 + GK GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Two HD video dome cameras (Bosch GmbH., Stuttgart, Germany) and one or two high resolution digital cameras (Canon HF100, Canon Inc., Tokyo, Japan; JVC Everio, JVC Kenwood Corporation, Kanagawa, Japan).	NHST Effect sized eta-squared (η_p^2)
Praça et al. (2016)	Compared the collective tactical behavior between numerically balanced and unbalanced SSG.	✗	LSG	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	LPM system (Inmotio Object Tracking BV., Amsterdam, the Netherlands) 15 Hz GPS (model SPI-Pro X2, GPSports, Canberra, Australia)	NHST Effect sized eta-squared (η_p^2)
Praça et al. (2021)	Analysed the effects of changing the match venue on match-related player's physiological, physical, and tactical responses with an age-dependent.	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	10 Hz GPS device, with an embedded 200 Hz accelerometer and 1 Hz heart rate monitor (Polar®, Team Pro, Kempele, Finland).	NHST Effect sized eta-squared (η_p^2)
(Ric, et al., 2016)	Identified the dynamics of tactical behaviour emerging on different timescales in SSG. Quantified short- and long-term exploratory behaviour according to the number of opponents.	✗	SSG	GK + 4 vs 3 + GK GK + 4 vs 5 + GK GK + 4 vs 7 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA) Lince software® (Gabi net al., 2012)	Digital video camera for video recording and analysed an ad hoc instrument being used to notate tactical actions (Costa et al. 2011) 15 Hz GPS (SPI-ProX, GPS ports, Canberra, ACT, and Australia)	Dynamic overlap <qd(t)> Trapping strength Boltzmann–Gibbs–Shannon entropy NHST Cohen' <i>d</i>
(Ric et al., 2017)	Identified how players' spatial restrictions affected the exploratory tactical behaviour and constrained the perceptual-motor workspace in ball possession and the inter-player passing interactions.	✗	SSG		✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	Dynamic overlap <qd(t)>

(Sampaio et al., 2014)	Compared and discriminate the time-motion variables, heart rate and players' tactical behaviour according to game pace, status and team unbalance.	✖	SSG	GK + 5 vs 5 + GK	✓	✓	✖	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	NHST SC
------------------------	--	---	-----	------------------	---	---	---	---	--	------------

Abbreviations: γ – Dynamic overlap; ApEn – Approximate entropy; CHAID – Chi-squared automatic interaction detection; Cohen's d – Standardized (Cohen) differences; CV – Coefficient of variation; GK – Goalkeeper; ICC – Intraclass correlation; LSG – Large-sided games; MBI – Magnitude-based inferences; MSG – Medium-sided games; ND – Not described; NHST – Null hypothesis statistical test; η_p^2 – Effect sized eta-squared; SampEn – Sample Entropy; SC – Structural coefficients; SEM – Standard error of measurement; SSG – Small-sided games; SWC – Smallest worthwhile changes; USA – United States; VSA – Visual Basic for Applications.
