Background: Positional data have been used to capture physical and tactical factors in football, however current research is now looking to apply spatiotemporal parameters from an integrative perspective. Thus, the aim of this article was to systematically review the published articles that integrate physical and tactical variables in football using positional data. **Methods and Materials:** Following the Preferred Reporting Item for Systematic Reviews and Meta-analyses (PRISMA), a systematic search of relevant English-language articles was performed from earliest record to August 2021. The methodological quality of the studies was evaluated using the modified Downs and Black Quality Index (observational and cross-sectional studies) and the Physiotherapy Evidence Database (PEDro) scale (intervention studies). **Results** The literature search returned 982 articles (WoS = 495; PubMed = 232 and SportDiscus = 255). After screening, 26 full-text articles met the inclusion criteria and data extraction was conducted. All studies considered the integration of physical and tactical variables in football using positional data ($n = 26$). Other dimensions were also reported, such as psychophysiological and technical factors, however the results of these approaches were not the focus of the analysis ($n = 5$). Quasi-experimental approaches considered training sets ($n = 20$) and match contexts ($n = 6$). One study analysed both training and play insights. Small sided-games (SSG) were the most common training task formats in the reviewed studies, with only three articles addressing medium-sided (MSG) ($n = 1$) and large-sided games (LSG) ($n = 2$), respectively. **Conclusions:** Among the current systematic review, the physical data can be integrated by player's movement speed. Positional datasets can be computed by spatial movement,

complex indexes, playing areas, intra-team and inter-team dyads. Futures researches should consider applying positional data in women's football environments and explore the representativeness of the MSG and LSG.

37   **Abstract**

38   **Background:** Positional data have been used to capture physical and tactical factors in football,

39   however current research is now looking to apply spatiotemporal parameters from an integrative

40   perspective. Thus, the aim of this article was to systematically review the published articles that

41   integrate physical and tactical variables in football using positional data.

42   **Methods and Materials:** Following the Preferred Reporting Item for Systematic Reviews and

43   Meta-analyses (PRISMA), a systematic search of relevant English-language articles was

44   performed from earliest record to August 2021. The methodological quality of the studies was

45   evaluated using the modified Downs and Black Quality Index (observational and cross-sectional

46   studies) and the Physiotherapy Evidence Database (PEDro) scale (intervention studies).

47   **Results** The literature search returned 982 articles (WoS = 495; PubMed = 232 and SportDiscus

48   = 255). After screening, 26 full-text articles met the inclusion criteria and data extraction was

49   conducted. All studies considered the integration of physical and tactical variables in football using

50   positional data (n = 26). Other dimensions were also reported, such as psychophysiological and

51   technical factors, however the results of these approaches were not the focus of the analysis (n =

52   5). Quasi-experimental approaches considered training sets (n = 20) and match contexts (n = 6).

53   One study analysed both training and play insights. Small sided-games (SSG) were the most

54   common training task formats in the reviewed studies, with only three articles addressing medium-

55   sided (MSG) (n = 1) and large-sided games (LSG) (n = 2), respectively.

56   **Conclusions:** Among the current systematic review, the physical data can be integrated by player's

57   movement speed. Positional datasets can be computed by spatial movement, complex indexes,

58   playing areas, intra-team and inter-team dyads. Futures researches should consider applying

59   positional data in women's football environments and explore the representativeness of the MSG

60   and LSG.

1. Introduction

Football can be characterized as a complex and dynamical system where the players collect ecological information's to make decisions, allowing them to gather numerical and spatial advantageous with a goal-orientation through the phases of play (Duarte et al., 2012; Folgado et al., 2014; Hewitt et al., 2016). Hence, football players carried out intermittent movements to perform individual and collective tactical actions (Clemente et al., 2020; Duarte et al., 2012; Low et al., 2019). The tracking systems have been used to compute spatiotemporal measures and assess players' position during training and match activities (Lames et al., 2010; Marcelino et al., 2020; Pol et al., 2020). Positional data can be captured at different frequencies by tracking systems such as global navigation satellite systems (GNSS) or global positioning systems (GPS) (Beato et al., 2018; Rago et al., 2019; Teixeira et al., 2021), local radio-based local positioning (LPM) (Hoppe et al., 2018; Leser et al., 2011; Ogris et al., 2012) and computerized-video or optical-based tracking systems (Beato & Jamil, 2018; Castellano et al., 2014; Di Salvo & Marco, 2006). The players and ball positioning can be computed by Cartesian and Euclidian coordinates (xx, yy) giving contextualize the physical demands on the tactical behaviour (Carrilho et al., 2020; Clemente et al., 2013; Low et al., 2020; Memmert et al., 2017). However, some of the above mentioned tracking methods do not allow to gather information about the player-ball-goal position (Carrilho et al., 2020; Vidal-Codina et al., 2022), opponent-adaptive play strategy (Memmert, 2021; Ranjitha et al., 2020) and individual tactical behavior (Laakso et al., 2022; Reis & Almeida, 2020).

Furthermore, the tracking systems generate a large quantity and variety of data that can be used for performance analysis in football contexts (Rein & Memmert, 2016; Rojas-Valverde et al., 2019). It is important implementing multidisciplinary frameworks between sports science and computer science based on big data methodology, using new computational procedures to extract,

85 process and analyse data with practical applicability for training and match performance (Rico-

86 González et al., 2021). However, integrating players' physical performance with match-related

87 contextual factors and tactical behaviours continues to represent a challenge for football science

88 (Teixeira et al., 2022). Moreover, the performance analysis in football needs a multidimensional

89 approach to capture the adaptive individual and collective behaviour (Carling et al., 2014;

90 Gonçalves et al., 2019). These multifactorial phenomenon depends on a physical, tactical and

91 technical factors with a not each performance factor is not mutually exclusive of one another

92 (Bradley & Ade, 2018; Paul et al., 2015). Thus, performance analysis in football is now focused

93 on applying the spatiotemporal parameters from an integrative perspective (Praça et al., 2022).

94   Currently, a growing reviews and meta-analysis have been published on this research topic

95 focusing on training and match insights (Low et al., 2020; Rago et al., 2020; Teixeira et al., 2021).

96 However, reviewing articles have considered each performance factor independently, describing

97 tactical behaviour separately from physical demands (Coito et al., 2022; Ometto et al., 2018). It is

98 therefore important to understand the main methodological procedures to conduct an integrative

99 analysis of physical and tactical performance in football training and match. Also, the published

100 studies have calculated different physical and tactical measures through tracking positional data,

101 wherefore a procedural standardization is needed to progress towards integrative approaches

102 (Teixeira et al., 2022). Thus, the aim of this study was to systematically review the published

103 articles that integrate physical and tactical variables in football using positional data.

2. Methods

2.1. Literature Search strategy

The literature search strategy was registered at the International Platform of Registered Systematic Review and Meta-Analysis Protocols with the number 202270030 (doi: 10.37766/inplasy2022.7.0030). The protocol was designed in accordance with 'The Preferred Reporting Items for Systematic Reviews and Meta-Analyses' (PRISMA) guidelines and the 'Population-Intervention-Comparators-Outcomes' (PICOS) (Page et al., 2021). The literature search was based on three databases: PubMed/Medline, Web of Science (WoS, including all Web of Science Core Collection: Citation Indexes), and SportDiscus. The studies were searched using a Boolean search phrase with specific keywords (Table 1).

[PLACE TABLE 1 HERE]

The literature search was accessed between April and May 2022 by an independently author (J.E.T), and checked by a second author (P.F.). Discrepancies between the authors in the study selection were solved with support a third reviewer (T.M.B). Double-check review is recommended in PRISMA guidelines (Page et al., 2021). The literature search was limited to peer-reviewed articles and authors did not prioritize authors or journals.

2.2. Selection criteria

The selection criteria were conducted by the following PICOS approach: (1) *Population*: amateur, semi-professional and professional Football players (aged $\geq$ 10 years); (2) *Intervention*: integration of physical and tactical measures using spatiotemporal datasets; (3) Comparison: physical and tactical variables (4) *Outcomes*: tracking, positional and time-series data; (5) *Study design*: original

125   experimental and quasi-experimental trials (e.g., randomized controlled trial, cohort studies or

126   cross-sectional studies).

127   On this basis, the inclusion criteria used for the article selection were: (1) original article

128   focused on adult and youth football players of both sexes; (2) studies with screening procedures

129   based on physical and tactical measures using tracking and positional data; (3) studies that used

130   spatiotemporal to assess physical data; (4) studies that used positional and tracking data to

131   measures spatiotemporal and tactical variables through time-series; (3) other performance factors

132   as psychophysiological, technical and contextual factors were not excluded from the present

133   review only if both variables of interest (i.e., physical and tactical measures) were also part of the

134   experimental design; (5) studies of human physical performance in Sport Science and as scope;

135   (6) original article published in a peer-review journal; (7) full text available in English; (8) article

136   reported sample and screening procedures (e.g. data collection, study design, instruments, and the

137   outcomes).

138   Otherwise, the exclusion criteria were: (1) original articles individual and others team

139   sports as football code population (e.g. Australian Football, Gaelic Football, Union and/or Seven

140   Rugby); (2) studies that study that analysed none or only one of the target performance factors (i.e.

141   physical or tactical measures); (3) studies which integrate several performance factors, but do not

142   combine the two variables of interest even if one of them is integrated; (4) studies that measured

143   physical using on field based test and laboratory test rather than tracking and positional data; (5)

144   studies that included tactical variables using notational analysis and other methodological

145   procedures that do not assess spatiotemporal data through time-series; (6) others research areas

146   and non-human participants; (7) articles with bad quality in the description of study sample and

147   screening procedures (e.g. data collection, study design, instruments, and the measures) according

148   to PEDro and Downs and Black scales; (8) reviews, abstract/papers conference, surveys, opinion

149   pieces, commentaries, books, periodicals, editorials, case studies, non-peer-reviewed text, masters

150   and/or doctoral thesis.

151   **2.3.   Quality Assessment**

152   The methodological quality was assessed using the modified Downs and Black Quality Index

153   (cross-sectional studies) and the Physiotherapy Evidence Database (PEDro) scale (intervention

154   studies) based on previous systematics reviews (Downs & Black, 1998; Maher et al., 2003). For

155   cross-sectional studies, the modified Downs and Black Index is scored from a 14-item scale, with

156   higher scores indicating higher quality studies. For intervention studies, the PEDro scale was

157   assessed using a 6-item scale representing the cut-off values for high-quality studies (Bujalance-

158   Moreno et al., 2019; García-Pinillos et al., 2017). Previous research have reported a good test–

159   retest ($r = 0.58–0.88$) and inter-rater reliability ($r = 0.68$ to 0.75) for both qualitative indexes

160   (Downs & Black, 1998; Maher et al., 2003). For this systematic review, the quality assessment

161   was independently performed by two authors (J.E.T, P.F.) with subsequent inter-observer

162   reliability analysis (Kappa index: 0.91; 95% IC: 0.90–0.92).

163   **2.4. Study Coding and Data Extraction**

164   The data extraction of the reviewed articles were organized into the following topics: (1) sampling

165   characteristics by the study design, population, competitive level, sample (N), sex, age, expertise

166   level and quality score (Table 2): (2) summary of performance dimension, measures, measurement,

167   thresholds and/or metric formula in the reviewed articles; references and 'further reading' reports

168   the original studies where the methodology of the included articles were based; (3) methodological

169 approaches of the reviewed studies by reporting the study purpose, experimental approach,

170 methodological procedures, data collection, statistical and mathematical analysis. Data were

171 collected as previously described in 'The Cochrane Data Extraction Template for Included

172 Studies' using a Microsoft Excel sheet (Microsoft Corporation, Readmon, WA, USA (Synnot et

173 al., 2020).

174 3. Results

175 3.1. Search Results and Study Selection

176 A total of 982 titles were collected through three database searches (WoS = 495; Pub-Med = 232

177 and SportDiscus = 255). After applying the selection criteria, 153 full-text articles were assessed

178 for eligibility, having selected 26 articles for final revision. Figure 1 showed the search results

179 using PRISMA flow diagram with screening procedures and search results.

180   **[PLACE FIGURE 1 HERE]**

181 3.2.   Participant Characteristics

182 The reviewed articles were published between 2000 and 2022. Studies samples were ranged

183 between 8–148 participants with an observational, prospective and cross-sectional design ($n = 8$)

184 and randomized controlled trial ($n = 18$). Twenty-three articles were focused on adult football

185 players and seven on youth population. All articles were performed on male football players,

186 specifically in elite ($n = 2$), professional ($n = 8$), high-level ($n = 1$), national level ($n = 2$), amateur

187 ($n = 2$) and volunteer ($n = 1$) contexts. A total of 538 football players were analysed in this

188 systematic review. Age and expertise level in the included studies was 16.81 ± 1.63 and 4.2 ± 3.83

189 years, respectively. Table 2 provides the sampling characteristics of the reviewed studies.

190   **[PLACE TABLE 2 HERE]**

191 **3.3. Quality Assessment**

192 In the evaluation of methodological quality, the qualitative scores for cross-sectional studies

193 ranged from 8 (lowest quality) to 11 (highest quality) within a maximum of 14 in Downs and Black

194 scale (Table 3). For intervention studies, the PEDro score ranged from 6 (lowest quality) to 9

195 (lowest quality) within a maximum of 11 (Table 4).

196 **[PLACE TABLE 3 HERE]**

[PLACE TABLE 4 HERE]

197 **3.4. Main Findings**

198 Table 5 presented the data extraction of the reviewed studies. Concerning the physical data, the

199 external training load measures considered were based on movement speed) specifically: (i) total

200 distance covered ($n = 11$), (ii) distance covered at different speed zones ($n = 13$), (iii) game pace

201 or average speed ($n = 3$), (iv) accelerations and decelerations ($n = 3$), (v) locomotive-based ratios

202 (e.g., ratio between the distance covered at different intensities and distance) ($n = 1$). Otherwise,

203 positional and tactical variables reported in the included studies was based on the following

204 independent variables: (i) possession ball ($n = 1$), (ii) spatial exploration indexes ($n = 6$), (iii) LPW

205 ratio ($n = 1$), (iv) stretch indexes ($n = 2$), (v) multiscale entropy ($n = 1$), (vi) synchronization indexes

206 (i.e., longitudinal and lateral directions) ($n = 10$), (v) intra-team and opponent's dyads ($n = 3$), (vi)

207 dispersion and contraction indexes (i.e., length, width and speed) ($n = 4$), (vii) playing space and

208 effectiveness (i.e., effective playing space, longitudinal distance between GK and the closest

209 defender ($n = 3$), (viii) player's variability, regularity and coordination ($n = 10$) (i.e., entropy,

210 dynamic overlap, near-in-phase and near-anti-phase coordination, regularity zones occupied), (ix)

211 team centroid ($n = 2$).

212   Table 6 showed the study purpose, game format, experimental approach, methodological

213   procedures, data collection, statistical and mathematical analysis of the included studies in this

214   review. The data organization respected the main purposes of this systematic review, specifically

215   the integration of physical and tactical variables in football using positional data ($n = 26$). Other

216   dimensions were also reported, such as psychological and technical factors, however the results of

217   these approaches were not the focus of the analysis ($n = 5$). Specifically, non-positional variables

218   were computed by the reviewed studies for other performance dimension such as technical ($n =$

219   4), tactical ($n = 5$) and psychophysiological variables ($n = 4$). Specifically, the psychophysiological

220   were reported by exertion-based indexes (i.e., exertion index per minute, ratings of perceived

221   exertion) ($n = 1$) and (vii) heart rate-based methods (i.e., $\%HR_{max}$, $TRIMP_{MOD}$) ($n = 3$).

222   Quasi-experimental approaches considered training sets ($n = 20$) and match contexts ($n =$

223   6). One study analysed both training and play insights. Small sided-games (SSG) were the most

224   common training task formats in the reviewed studies ($n = 17$), with only three articles addressing

225   medium-sided (MSG) ($n = 1$) and large-sided games (LSG) ($n = 4$), respectively. Regarding the

226   methodological procedures, Matlab® routines (Math-Works, Inc., Massachusetts, USA) were used

227   by all authors for processing raw data (xx, yy) (n = 26). All studies applied Butterworth low pass

228   filter at frequency sampling ranged between 3–5 Hz using 10–20 windows and 1000–3000 points

229   per data collect. Match analysis software were applied for to extract technical variables into three

230   studies, specifically the LongoMatch® software ($n = 1$), Match Analysis Camera Systems® ($n = 1$)

231   and Lince software ($n = 1$). Data collection was based on GPS ($n = 15$), LPM ($n = 2$) and optical-

232   based tracking systems ($n = 5$) ranging from 5 to 15 Hz. Also, internal training load measures was

233   collected by 1 Hz short-range radio telemetry ($n = 2$) and CR 10-scale ($n = 1$). A study used

234 portable optical timing system to measure neuromuscular performance (i.e., countermovement

235 jump, CMJ).

236   A null hypothesis statistical test (NHST) and magnitude-based inferences (MBI) in seven

237 studies ($n = 7$) and five studies ($n = 5$), respectively. The statistical and mathematical analysis

238 performed in the reviewed reports were the approximate entropy (ApEn) ($n = 7$), Boltzmann–

239 Gibbs–Shannon entropy measure ($n = 7$), Coefficient of variation (CV) ($n = 7$), dynamic overlap

240 (<qd(t)>) ($n = 7$), effect sized Cohen d ($n = 7$), effect sized eta-squared (η_p^2) ($n = 7$), hilbert

241 transform ($n = 7$), intraclass correlation (ICC) ($n = 7$), smallest worthwhile changes (SWC) ($n =$

242 7), standard error of measurement (SEM) ($n = 7$), standardized (Cohen) differences ($n = 7$),

243 structural coefficients (SC) ($n = 7$), and trapping strength ($n = 7$).

244   **[PLACE TABLE 5 HERE]**

245   **[PLACE TABLE 6 HERE]**

4. Discussion

246

247 The aim of this study was to systematically review the published articles that integrate physical

248 and tactical variables in football using positional data. Earliest, the physical data was analysed by

249 the player's movement speed. Otherwise, positional datasets was computed by spatiotemporal

250 features such as spatial variability or regularity of the player's movements, complex index,

251 coordination/synchronization using intra-team and inter-team dyads, playing space.

252 Positional datasets allows a more ecological approach to individual physical demands, if

253 the data interpretation considers the contextual factors and collective behaviour through a tactical

254 analysis (Marcelino et al., 2020; Teixeira et al., 2022; Teixeira et al., 2021). As well, several

255 authors have emphasized the need to recklessness the one-dimensional research. It is important to

256 apply methodologies based on integrative approaches that analyse the interdependence between

257 technical factors, key tactical/performance indicators, collective behaviour and match-related

258 contextual factors (Teixeira et al., 2022). Therefore, an integrative approach was extended in 8

259 articles by adding psychophysiological and technical outcomes (Bradley & Ade, 2018; Paul et al.,

260 2015). Considering the multifactoriality of performance in team sports as football, it is also

261 important to consider the influence of psychological variables on the control of physical capacities,

262 pacing behaviour, decision-making, self-regulation, and effort perception (Branquinho et al., 2020,

263 2021; Ferraz et al., 2022). Also, the bringing together of observational methodologies should be

264 considered when positional data is to be made meaningful with skilled and technical aspects

265 (Anguera & Mendo, 2013; Preciado et al., 2019; Sarmento et al., 2018).

266 Moreover, the reviewed quasi-experimental approaches considered training sets and match

267 contexts. Small sided-games (SSG) were the most common training task formats in the reviewed

268 studies, with only three articles addressing medium-sided (MSG) and large-sided games (LSG)

269 (Machado et al., 2020; Folgado et al., 2018; Gonçalves et al., 2017; Jara et al., 2019; Nieto et al.,

270   2022; Praça et al., 2016), respectively. Thus, the SSG formats have been further explored in the

271   literature, mainly through the 5- and 6-sided game format. Indeed, these SSG-based formats was

272   previous reported as an useful tool to promote into significant variations in the training load, and

273   in the likely improvement of the different domains of soccer training (i.e., physiological, technical,

274   and tactical dimensions) (Branquinho & Marques, 2021; Clemente et al., 2021). Also, SSG and

275   conditioned games (SSCG) are an excellent form to enhance acquisition of motor efficiency and

276   decision-making skills (Davids et al., 2013). A widespread research gap remains unexplored in

277   MSG and LSG formats, as well as their relationship with formal game formats (i.e., 7-, 8-, 9- and

278   11-sided formats) (Baptista et al., 2020; Coutinho et al., 2019, 2020; Ferraz et al., 2020; Figueira

279   et al., 2018; Gonçalves et al., 2017; Sampaio et al., 2014).

280   Regarding the methodological procedures, Matlab® routines (Math-Works, Inc.,

281   Massachusetts, USA) were applied to process raw data (xx, yy) ($n = 26$), transforming data points

282   in the Universal Transverse Mercator (UTM) coordinate system (Folgado et al., 2014; Sampaio &

283   Maças, 2012). The most used correction guidelines to reduce tracking signal noise was a 3 Hz

284   Butterworth low pass filter by applying a non-linear logarithms using 20 windows of 3000 points

285   per data collect (Coutinho et al., 2019, 2020; Figueira et al., 2018; Folgado et al., 2015, 2019;

286   Gonçalves et al., 2017, 2018). Other studies used smaller data windows such as 1500 data sets

287   and a sampling frequency for signal correction (i.e., 5Hz) (Baptista et al., 2020). Nevertheless, the

288   sampling frequency and datasets is highly dependent on the type of non-linear method to be used,

289   and the use of higher time-series lengths can increase the consistency of the positional data

290   (Baptista et al., 2020; Richman & Moorman, 2000; Yentes et al., 2013). Approximate entropy

291   (ApEn) was the most applied non-linear method for measuring the spatial movement

292   variability/regularity (Baptista et al., 2020; Coutinho et al., 2019, 2020; Ferraz et al., 2020;

293   Figueira et al., 2018; Gonçalves et al., 2017; Sampaio et al., 2014). Also, stretch index can be

294   based on the ApEn or distance, being the most reported complex index in the reviewed literature

295   (Coutinho et al., 2019; Olthof et al., 2018; Praça et al., 2021). Indeed, the entropy has been

296   extensively reported as outstanding informational parameter to describe the variability and

297   predictability of the players' movement (Teixeira et al., 2022). Hilbert transform was the most

298   frequent method, by computing the longitudinal and lateral directions through in- and anti-phase

299   (Coutinho et al., 2019, 2020; Fernandes et al., 2010; Figueira et al., 2018; Folgado et al., 2015,

300   2019; Gonçalves et al., 2017, 2018). Total surface area or playing space (m^2) can be provided

301   through trigonometry using the smallest convex hull and/or polygonal area delimited by the

302   peripheral players (Coutinho et al., 2017; Folgado et al., 2019; Olthof et al., 2018). Recently,

303   Teixeira et al. (2022) reported what remains to be explored correlation matrixes, clustering

304   methods and fractality patterns. This review confirms this and opens up the possibility of exploring

305   these metrics by integrating physical demands with individual and collective behaviour.

306   Match analysis software were applied in reviewed three studies for notational analysis to

307   extract technical variables, specifically the LongoMatch® software, Match Analysis Camera

308   Systems® (Gonçalves et al., 2018) and Lince software® (Canton et al., 2021; Ric et al., 2016).

309   Further tactical variables was applied in the reviewed studies using other methodological

310   approaches (i.e., observational and notational analysis) such as metrics based on ball possession,

311   team networks and tactical actions classifications. Technical outcomes were mainly based on

312   individual actions and skills characterized in quantity and success (i.e., successful passes, dribbles

313   and shots) (Coutinho et al., 2020, 2022a; 2022b; 2022c; Folgado et al., 2019; Olthof et al., 2018;

314   Ric et al., 2017). Data collection was based on GPS, LPM and optical-based tracking systems

315   ranging from 5 to 18 Hz. The first studies were mainly based on 5 Hz GPS (SPI-Pro X II, GPS

316 ports, Canberra, ACT, and Australia), however the use of sampling frequency at 5Hz must consider

317 some limitations in the measurement of non-linear and high-intensity paths (Portas et al., 2010;

318 Teixeira et al., 2021). Authors should prioritise tracking devices with sampling frequencies above

319 10 Hz shape with an accelerometer (Gómez-Carmona et al., 2020; Rico-González et al., 2020).

320 The latest GPS devices already recommend a sampling frequency of 10-18Hz, specifically 10 Hz

321 GPS units (WIMU PRO, RealTrack Systems, Almeria, Spain) (Canton et al., 2021; Machado et

322 al., 2022), 10 Hz GPS (S5, Catapult Innovations, Australia) (Folgado et al., 2019; Nieto et al.,

323 2022), 10 Hz GPS (Polar, Team Pro, Kempele, Finland) (G. M. Praça et al., 2021), 15Hz GPS

324 (SPIPRO, GPSports, Canberra, ACT, Australia) (Coutinho et al., 2017; Praça et al., 2016; Ric et

325 al., 2016) and 18.18 Hz GPS (GPEXE GK, Exelio SRL, Udine, Italy) (Jara et al., 2019). LPM

326 devices and semiautomatic video tracking system used in the surveyed studies were the Prozone®

327 (ProZone Holdings Ltd, UK) (Folgado et al., 2015) and the Inmotio Object Tracking® (BV.,

328 Amsterdam, the Netherlands) (Olthof et al., 2018). The integration of the different tracking

329 systems can be further explored from an integrative perspective (Buchheit et al., 2014; Linke et

330 al., 2018). Also, the relationship between objective (i.e., tracking systems) and subjective (i.e.,

331 observational/notational analysis) measures should be explored in future integrative approaches,

332 in order to make the integration of technical and tactical factors more effective (Teixeira et al.,

333 2021b). Indeed, the non-positional data can act as a complement to the positional raw data by

334 making the information gathered from the tracking systems more viable and richer (Praça et al.,

335 2022, Teixeira et al., 2021b)

336 Likewise, internal training load was collected by heart-rate-based measures and perceived

337 exertion. Although some limitations have been reported in some studies, the perceived exertion

338 and heart-rate maintains its applicability for elite and sub-elite football contexts, and is lower cost

339 and more easily implemented (Achten & Jeukendrup, 2003; Teixeira et al., 2022; Teixeira, Forte,

340 et al., 2021b). A study used portable optical timing system to measure neuromuscular performance

341 (i.e., countermovement jump, CMJ). The field-based tests in football becomes more effective when

342 continuous control (i.e. monitoring) is integrated into the assessment (Clemente et al., 2022;

343 Gomez-Carmona et al., 2020).

344   A null hypothesis statistical test (NHST) and magnitude-based inferences (MBI) in seven

345 studies and five studies, respectively. Some authors used joint approaches for their data handling,

346 as well as statistical analysis such as coefficient of variation (CV) ($n = 7$), effect sized (ES) and

347 smallest worthwhile changes (SWC) (Bernards et al., 2017; Flanagan, 2013).The application of

348 the two statistical approaches makes it more difficult to compare results of the availed studies, and

349 future studies should further analyse the potential overvaluation and bias of the study findings

350 (Foster et al., 2017; Welsh & Knight, 2015). Bringing NHST and MBI approaches together may

351 be a valid approach to avoid overestimating outcomes (Welsh & Knight, 2015).

352   The current systematic review has some limitations should be consider. First, the

353 interpretation of the studies was only qualitative, not considering meta-analysis. Second, the fact

354 that only studies that integrated the physical and tactical measures and not just one dimension. For

355 this reason, other information about physical and behavioural data may have been absent (Duarte

356 et al., 2013; Folgado et al., 2014; Vilar et al., 2014). Although this was made objective in the

357 inclusion and exclusion criteria, future systematic reviews should clarify which studies used both

358 one-dimensional and integrative approach. As practical applications and futures researches, there

359 are some future topics that could be explored specifically: (i) the development of friendly-user

360 interfaces, in order to disseminate positional data until now almost exclusively to Matlab® routines

361 processing (Math-Works, Inc., Massachusetts, USA); (ii) developing tracking and wearables

362 devices which enable real-time feedback to increase the practical applicability and decision

363 making of football players and coaching staff; (iii) applying advanced data analytics and big data-

364 based methods using artificial intelligence (AI), machine learning (ML) and deep learning to

365 compute automatically physical and positional data; (iv) manipulating task constraints in MSG,

366 LSG and different game-formats can still be better exploited; woman's football is still not analysed

367 using physical and tactical integration.

368 ## 5. Conclusions

369 Among the current systematic review, the physical and tactical factors can be integrated by

370 positional data using player's movement speed, spatial movement (and their variability, regularity

371 or predictability), complex indexes, playing areas, intra-team and inter-team synchronization

372 dyads. Futures research should consider applying positional data in women's football and explore

373 the representativeness of the MSG and LSG in youth training environments. Although positional

374 data is being extensively applied in semi-professional and professional football, forthcoming

375 challenge focuses on the development of friendly-user and real-time interfaces to integrate

376 physical and tactical measures

Table 5 – Summary of performance dimensions, measures, measurements and their thresholds/metric formulas in the included articles.

Dimension	Measure	Measurement	Description, thresholds and/or metric formula	Reference	Further reading
Physical data	External load	Movement speed	**TD (m)** — Higher Ratio (> 16 km·h⁻¹), Moderate Ratio (10.0–15.9 km·h⁻¹), Lower Ratio: 7.0–9.9 km·h⁻¹ with distance covered at very low intensities (0.0–6.9 km·h⁻¹)	(Canton et al., 2021; Coutinho et al., 2019; Coutinho et al., 2019)	(Abade et al., 2014; Bradley & Ade, 2018; Hodgson et al., 2014)
			Walking (0.0–3.5 km·h⁻¹), Jogging (3.6–14.3 km·h⁻¹), Running (14.4–19.7 km·h⁻¹), and Sprinting (>19.8 km·h⁻¹).	(Coutts & Duffield, 2010; Ferraz et al., 2020; Figueira et al., 2018; Folgado et al., 2015, 2018; Gonçalves et al., 2017; Gonçalves et al., 2018; Ric et al., 2016; Ric et al., 2017)	(Duarte et al., 2013; Folgado et al., 2014; Giménez et al., 2018; Gonçalves et al., 2017)
			Zone 1 (0–6.9 km·h⁻¹); zone 2 (7–9.9 km·h⁻¹); zone 3 (10–12.9 km·h⁻¹); zone 4 (13–15.9 km·h⁻¹); zone 5 (16–17.9 km·h⁻¹) and zone 6 (≥18 km·h⁻¹).	(Sampaio et al., 2014)	(Hill-Haas et al., 2008)
			High Speed (km·h⁻¹) — Distance covered in the high ratio/distance covered in walking multiplied by 100.	(Coutinho et al., 2019; Coutinho et al., 2019)	(Abade et al., 2014; Gonçalves et al., 2018)
			Distance covered at high intensity (≥ 19.8 km·h⁻¹) and number of sprints (frequency of displacements ≥ 25.2 km·h⁻¹)	(Olthof et al., 2018)	(Abt & Lovell, 2009; Goto et al., 2015)
			Distance covered at three speed zones (14.40–19.79 km·h⁻¹, 19.80–22.99 km·h⁻¹, higher than 23.00 km·h⁻¹) and number of sprints (frequency of displacements ≥ 23.00 km·h⁻¹)	(Praça et al., 2021)	(Mallo et al., 2015; Praça et al., 2020)
		Game Pace or Average Speed (km·h⁻¹ *or* CV)	Players' average speed displacement, expressed as meters or CV.	(Canton et al., 2021; Coutinho et al., 2019; Coutinho et al., 2019)	(Ferraz et al., 2017, 2018; Gonçalves et al., 2019)
		ACC/DEC (m·s⁻²)	ACC: 0.5-3.0 m·s⁻²; DEC: > -3.0 0 m·s⁻²	(Coutinho et al., 2017)	(Dalen et al., 2016; Russell et al., 2016)
		Body load	$$\frac{\sqrt{(a_{y1} - a_{y-1})^2 + a_{x1} - a_{x-1})^2 + (a_{z1} - a_{z-1}))^2}}{100}$$	(Gonçalves et al., 2017)	(Buchheit et al., 2014)
Positional data	Spatial and temporal features	Spatial movement variability/regularity	**CV** — Magnitude of the variability in the distance between players', expressed by the coefficient of variation CV (%)	(Coutinho et al., 2019; Coutinho et al., 2020; Figueira et al., 2018; Gonçalves et al., 2017)	(Frencken et al., 2012; Harbourne & Stergiou, 2009; Seifert et al., 2013; Travassos et al., 2014)
			ApEn — Ranged 0 to 2, in which lower values correspond to more repeatable patterns). The imputed values used to compute were 2 to vector length (m) and 0.2*std to the tolerance (r).	(Baptista et al., 2020; Coutinho et al., 2020; Coutinho et al., 2019; Ferraz et al., 2020; Figueira et al., 2018; Gonçalves et al., 2017; Sampaio et al., 2014)	(Duarte et al., 2012; Gonçalves et al., 2016; Gréhaigne et al., 1997; Pincus, 1991; Preatoni et al., 2010; Richman & Moorman, 2000; Seifert et al., 2013; Silva, Duarte, et al., 2016; Stergiou et al., 2004; Yentes et al., 2013)
			Boltzmann–Gibbs–Shannon entropy — Probabilities of configurations were calculated as limit (large N) relative frequencies for stationary distributions: $pi - ni/N$ where ni and N is the frequency and number of the configuration respectively.	(Ric et al., 2016)	(Balescu, 1975)
			MSE SamEn — SampEn and MSE curves to a range of different timescales, calculating the area under and complexity index.	(Canton et al., 2021)	(Busa & van Emmerik, 2016; M. Costa et al., 2005)
		Complex Index	**SEI** — Width and length displacements from each positioning time series to the mean position.	(Canton et al., 2021; Figueira et al., 2018; Gonçalves et al., 2017; Praça et al., 2021)	(Arede et al., 2021; Clemente et al., 2018; Clemente et al., 2018; Travassos et al., 2014)
			Stretch Index (meters or ApEn) — Men of the distances between each player and the geometric centre of the team.	(Coutinho et al., 2019; Olthof et al., 2018; Praça et al., 2021)	(Bourbousson et al., 2010; Clemente et al., 2013; Clemente et al., 2018; Duarte et al., 2013; Lames et al., 2010; Travassos et al., 2014)
			Dynamic overlap <qd(t)> — Average cosine auto-similarity of the overlap between configurations with increasing time lag: $$<q_d(t)> = (1 - q_{stat})t^\alpha + q_{stat}$$	(Ric et al., 2016)	(Hristovski et al., 2013; Saxton, 1996)
			Trapping strength — Probability of remaining inside the same attractor that is a conditional probability of a configuration being subsequently repeated (i.e., trapping strength and behavioural flexibility).		

		Voronoi algoritms	Voronoi algorithms allow to compute a diagram represented by spatial cells for individual positional area (m²).	(Baptista et al., 2020)	(Fonseca et al., 2012)
	Coordination/synchronization using intra-team dyads	Relative phase (Hilbert transform)	Longitudinal and lateral directions using near-in-phase synchronization of each dyad that was quantified by the percentage of time spent between −30º to 30º bin.	(Coutinho et al., 2020; Coutinho et al., 2019; Fernandes et al., 2010; Figueira et al., 2018; Folgado et al., 2015, 2019; Gonçalves et al., 2018; Gonçalves et al., 2017)	(Duarte et al., 2012; Duarte et al., 2012; Duarte et al., 2013; Folgado et al., 2014; Gonçalves et al., 2019; McGarry et al., 2002; Palut & Zanone, 2005; Sampaio & Vitor, 2012; Silva et al., 2016; Travassos et al., 2011a, 2011b, 2013)
		Speed synchronisation	0.0–3.5 km·h⁻¹ (low intensity); 3.6–14.3 km·h⁻¹ (moderate intensity); 14.4–19.7 km·h⁻¹ (high intensity); and >19.8 km·h⁻¹ (very high intensity).	(Folgado et al., 2018; Gonçalves et al., 2018)	(Folgado et al., 2014)
	Coordination/synchronization using inter-team dyads	Distance Player–Teammate Distance Player–Opponent	Interpersonal distance between each pair of players, both with teammates and opponents: $D\left(a_{x_{(t)},y_{(t)}}, b_{x_{(t)},y_{(t)}}\right) = \sqrt{\left(a_{x_{(t)},y_{(t)}}\right)^2 + \left(a_{x_{(t)},y_{(t)}}\right)^2}$ Where D is the distance, a is the player, x and y are the coordinates, and t is the time, and b is the teammate or opponent.	(Ferraz et al., 2020; Olthof et al., 2018; Ric et al., 2017; Sampaio et al., 2014)	(Gonçalves et al., 2014; Low et al., 2020; Silva et al., 2016)
		Distance from the target	Distance from the target according to ten categories: >37.45 m; 32.1 ± 37.45 m; 36.75 ± 32.1 m; 21.4 ± 26.75 m; 16.05 ± 21.4 m; 10.7 ± 16.05 m; 5.35 ± 10.7 m; 0 ± 5.35 m.	(Ric et al., 2017)	(Duarte, Araújo, Davids, et al., 2012)
		Total surface area or team effective playing space (m²)	Smallest convex hull, that is the smallest polygonal area that it is delimited by the peripheral players	(Coutinho et al., 2017; Folgado et al., 2019; Olthof et al., 2018)	(Duarte et al., 2013; Folgado et al., 2014; Mendes et al., 2007; Ric, Torrents, et al., 2016; Russell et al., 2016; Sampaio & Vitor, 2012)
	Playing Space	Ellipses: SEA and PEA areas	Spatial analysis for a set of points in a two-dimensional space, which boundaries will enclose about the $100(1 - \alpha)$: $\bar{x} = \frac{1}{n}\sum_{i=0}^{n}x_i, \bar{y} = \frac{1}{n}\sum_{i=1}^{n}y_i$	(Jara et al., 2019)	(Batshcelet, 1981; Lefever, 1926; Yuill, 1971)
		Team's width and length Team's speed contraction dispersion Team centroid	Longitudinal position of team geometrical center (x axis) and lateral position of team geometrical center (y axis), expressed as meters, CV and length-per-width (LPW) ratio per team.	(Baptista et al., 2020; Canton et al., 2021; Coutinho et al., 2017; Gonçalves et al., 2017; Praça et al., 2021)	(Duarte et al., 2013; Folgado et al., 2014; Frencken et al., 2011; Mendes et al., 2007; Ric et al., 2016)
Other dimensions (non-positional data)	Technical variables	Individual actions	Passes, dribbles and shots	Successful Passes (%), Successful Dribbles (%), Shots on Target (%), Goals (%)	(Coutinho et al., 2020)	(Liu et al., 2016; O'Donoghue, 2009; Santos et al., 2018)
			Distance covered at different intensities when dribbling; number of completed passes; completed passes distance; shots distance to the goal; distance between attacker and defender when shooting.	(Folgado et al., 2019; Olthof et al., 2018)	(Rampinini et al., 2009)
			Successful pass reception and turnovers, goals scored and relative frequencies of players' passing interactions.	(Ric et al., 2017)	(Costa et al., 2005)
			Transition probabilities were calculated dividing the number of each player's passes to his teammates, turnovers and goals by the total number of player interactions.		
	Tactical variables	Ball Possession	Offensive/Defensive Phases	Duration of possession, team width, team length and their ratio (LPWR), as well as their coefficient of variation	(Canton et al., 2021; Olthof et al., 2018; Ric, Hristovski, et al., 2016)	(Collet, 2013; Costa et al., 2011; Gabin et al., 2012)
		Network	Dyad Nodes	Relative phase analysis was also divided according to each dyad average speed in three levels: for the whole team; for dyads with similar synchronisation tendencies; and for each dyad.	(Folgado et al., 2015; Ric et al., 2017)	(McGarry et al., 2002; Travassos et al., 2011a, 2013)
		Tactical actions	Patterns/Categories	Tactical actions classified as: penetration, offensive coverage, depth mobility, width and length, offensive unity, delay, defensive coverage, balance, concentration, defensive unity.	(Ric et al., 2017)	(M. Costa et al., 2005)
	Psychophysiological variables	Perceived Exertion	RPE (a.u.)	CR10-scale (0 to 10 arbitrary units).	(Coutinho et al., 2017)	(Lee et al., 1991)

	Exertion index	Wisbey's formula: players' instantaneous speed (over 10 s and speed over 60 s).	(Folgado et al., 2015)	(Wisbey et al., 2010)
Heart Rate	HR_{max} (bpm)	Percentage of HR_{max} into intensity zones: Zone 1 (<75% HR_{max}), Zone 2 (75–84.9% HR_{max}), Zone 3 (85–89.9% HR_{max}), and Zone 4 (≥90% HR_{max}).	(Folgado et al., 2018; Sampaio et al., 2014)	(Abt & Lovell, 2009; Gore, 2000)
	Average HR (bpm)	Average beats per minute (BPM)	(Gonçalves et al., 2017)	ND
	$TRIMP_{MOD}$	Total $TRIMP_{MOD}$: zone 1 (65–71% HR_{max})*1.25; zone 2 (72–78% HR_{max})*1.71; zone 3 (79–85% HR_{max})*2.54; zone 4 (86–92% HR_{max})*3.61; and zone 5 (93–100% HR_{max})*5.16	(Folgado et al., 2018)	(Campos-Vazquez et al., 2015; Los Arcos et al., 2014; Stagno et al., 2007)

Abbreviations: <qd(t)> – Dynamic overlap; ACC/DEC – Accelerations and decelerations; ApEn – Approximate entropy; BPM – Average beats per minute; CR-10 – Borg CR10 scale; CV – Coefficient of variation; D – Distance; HR – Heart Rate; HR_{max} – maximum Heart Rate; LPWR – Team width, team length and their ratio or LPW – length-per-width ratio per team; MSE – Multiscale Entropy; PEA – Prediction Ellipse; RPE – Ratings of Perceived Exertion; SamEn – Sample Entropy; SEA – Standard Ellipse; SEI – Spatial exploration index; TD – Total distance; TRIMP – Training Impulse; $TRIMP_{MOD}$ – modified Training Impulse.

					Experimental Approach					
Baptista et al. (2020)	Identified the effects of playing formations on tactical behaviour and external workload during SSG.	✗	SSG	GK + 7 vs 7 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Non-differential 5Hz GPS (ND)	Cohen' *d* SWC MBI ApEn Voronoi algorithme
Canton et al. (2021)	Identified how positioning the goals in diagonal configurations on the pitch modifies the external training load and the tactical behaviour during SSG.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA) Lince software® (Gabin et al., 2012),	10 Hz GPS units (WIMU PRO, RealTrack Systems, Almeria, Spain)	Cohen' *d* SWC MBI NHST
Coutinho et al. (2017)	Examined the effects of mental fatigue and additional corridor and pitch sector lines on players' physical and tactical performances during SSG.	✗	SSG	GK + 6 vs 6 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	CR10-scale (RPE) Portable optical timing system (Optojump, Microgate, Bolzano, Italy) 15Hz GPS (SPIPRO, GPSports, Canberra, ACT, Australia)	Cohen' *d* SWC NHST
Coutinho et al. (2019)	Identified the effects of adding spatial references during SSG on players' tactical and physical performance.	✗	SSG	GK + 6 vs 6 +GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	CV ApEn MBI NHST
Coutinho et al. (2019)	Identified the effects of different pitch configurations on players' positional and physical performance.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	CV ApEn MBI NHST
Coutinho et al. (2020)	Compared players' performances when manipulating the external markings of the pitch during SSG.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo)	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia) Digital video camera (Sony NV-GS230)	CV ApEn MBI NHST
Coutinho et al. (2022)	Explored how the number of allowed ball touches per player possession affected the performance of different age groups during SSG.	✗	SSG	GK + 6 vs 6 +GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	Cohen' *d* SWC NHST Hilbert transform
Coutinho et al. (2022)	Aimed to identify the effects of playing with additional individual, collective or individual-collective variability on players' performance during SSG.	✗	SSG	GK + 6 vs 6 +GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	Cohen' *d* NHST Hilbert transform
Coutinho et al. (2022)	Explored how manipulating the colour of training vests affects footballers' individual and collective performance during SSG.	✗	SSG	GK + 6 vs 6 +GK	✓	✓	✓	Matlab® routines (Math-Works, Inc., Massachusetts, USA) LongoMatch software (Longomatch, version 1.3.7., Fluendo	5 Hz GPS (SPI-PRO, GPSports, Canberra, ACT, Australia)	Cohen' *d* NHST Hilbert transform
Ferraz et al. (2020)	Identified how the manipulation of knowledge regarding a training task duration constrains the pacing and tactical behaviour in SSG.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✓	ND	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	ApEn MBI
Figueira et al. (2018)	Compared footballers' performances when playing with teammates and opponents from the same or different age groups	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	CV ApEn MBI
Folgado et al. (2015)	Examined the physical and tactical performances under congested and non-congested fixture periods	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Semiautomatic tracking system (Prozone®, ProZone Holdings Ltd, UK).	CHAID Cohen' *d* NHST Hilbert transform
Folgado et al. (2018)	Identified changes in tactical, physical and physiological performances in LSG during the preseason.	✗	LSG	GK + 8 vs. 8 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	NHST Cohen' *d*
Folgado et al. (2019)	Compared players' performance during two SSG with different pitch orientation (i.e., 40x30m vs 30x40m).	✗	SSG	GK + 4 vs 4 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	10 Hz GPS (MinimaxX S5, Catapult Innovations, Australia) Digital Vídeo Camera (Canon PowerShot SX720 HS, Canon Inc,	ICC SEM Cohen' *d* SWC

								Tokyo, Japan),	MBI
Gonçalves et al. (2014)	Identified differences in time–motion, modified training impulse, body load and movement behaviour between defenders, midfielders and forwards, during an 11-a-side simulated football game.	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia) 1 Hz short-range radio telemetry (Polar Team Sports System, Polar Electro Oy, Finland)	Hilbert transform ApEn NHST
Gonçalves et al. (2017)	Identified how pitch area restrictions affect the players' tactical behavior, physical, and physiological performances during LSG.	✗	LSG	GK + 9 vs. 9 + GK GK+ 10 vs. 10 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia) 1 Hz short-range radio telemetry (Polar Team Sports System, Polar Electro Oy, Finland)	Hilbert transform CV ApEn Cohen' d SWC MBI
Gonçalves et al. (2018)	Examined the changes in the players' speed synchronization and physical performance between the first and the second half (15- min time). Explored the match-to-match variation of players' speed synchronization performance.	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Match Analysis Camera System®.	Hilbert transform CV Cohen' d SWC MBI
Jara et al. (2019)	Analyzed how the modification of the pitch size in SSGs affects the GK's physical demands.	✗	SSG MSG LSG	ND	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	18.18 Hz GPS (GPEXE GK, Exelio SRL, Udine, Italy)	Cohen' d MBI NHST
Machado et al. (2022)	Investigated how different strategies of task constraint manipulation impact physical and tactical demands in small-sided and conditioned games (SSCG)	✗	SSG	GK + 4 vs 4 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA) and SPRO™ (RealTrack System, Almería, Spain)	10 Hz GPS and inertial devices (WIMU ProTM and GPS, RealTrack System, Almería, Spain)	Effect size (ND) NHST
Nieto et al. (2022)	Described the effects on player's collective behaviour and physical response in three different pitch lengths (100, 75 and 50 m) keeping the width constant (60 m)	✗	LSG	GK + 11 vs 11 + GK	✓	✓	✗	Microsoft Excel Visual Basic for Applications (VBA) (Microsoft, Redmond, WA, USA)	10 Hz GPS (MinimaxX S5, Catapult Innovations)	Cohen' d MBI NHST SampEn
Olthof et al. (2018)	Investigated SSGs with a traditional small pitch and a match-derived relative pitch area in youth elite soccer players.	✓	SSG	GK + 4 vs 4 + GK GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	Two HD video dome cameras (Bosch GmbH., Stuttgart, Germany) and one or two high resolution digital cameras (Canon HF100, Canon Inc., Tokyo, Japan; JVC Everio, JVC Kenwood Corporation, Kanagawa, Japan). LPM system (Inmotio Object Tracking BV., Amsterdam, the Netherlands)	NHST Effect sized eta-squared (η_p^2)
Praça et al. (2016)	Compared the collective tactical behavior between numerically balanced and unbalanced SSG.	✗	SSG	3 vs 3 3 vs 3 + 2 4 vs 3	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	15 Hz GPS (model SPI-Pro X2, GPSports, Canberra, Australia)	NHST Effect sized eta-squared (η_p^2)
Praça et al. (2021)	Analysed the effects of changing the match venue on match-related player's physiological, physical, and tactical responses with an age-dependent.	✓	-	GK + 11 vs 11 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	10 Hz GPS device, with an embedded 200 Hz accelerometer and 1 Hz heart rate monitor (Polar®, Team Pro, Kempele, Finland).	NHST Effect sized eta-squared (η_p^2)
(Ric, et al., 2016)	Identified the dynamics of tactical behaviour emerging on different timescales in SSG. Quantified short- and long-term exploratory behaviour according to the number of opponents.	✗	SSG	GK + 4 vs 3 + GK GK + 4 vs 5 + GK GK + 4 vs 7 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA) Lince software® (Gabi net al., 2012)	Digital video camera for video recording and analysed an ad hoc instrument being used to notate tactical actions (Costa et al. 2011) 15 Hz GPS (SPI-ProX, GPS ports, Canberra, ACT, and Australia)	Dynamic overlap <qd(t)> Trapping strength Boltzmann–Gibbs–Shannon entropy NHST Cohen' d
(Ric et al., 2017)	Identified how players' spatial restrictions affected the exploratory tactical behaviour and constrained the perceptual-motor workspace in ball possession and the inter-player	✗	ND	GK + 10 vs 9 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	Dynamic overlap <qd(t)>

	passing interactions.									
(Sampaio et al., 2014)	Compared and discriminate the time-motion variables, heart rate and players' tactical behaviour according to game pace, status and team unbalance.	✗	SSG	GK + 5 vs 5 + GK	✓	✓	✗	Matlab® routines (Math-Works, Inc., Massachusetts, USA)	5 Hz GPS (SPI-Pro X II, GPS ports, Canberra, ACT, and Australia)	NHST SC

Abbreviations: <qd(t)> – Dynamic overlap; ApEn – Approximate entropy; CHAID – Chi-squared automatic interaction detection; Cohen's d – Standardized (Cohen) differences; CV – Coefficient of variation; GK – Goalkeeper; ICC – Intraclass correlation; LSG – Large-sided games; MBI – Magnitude-based inferences; MSG – Medium-sided games; ND – Not described; NHST – Null hypothesis statistical test; η_p^2 – Effect sized eta-squared; SampEn – Sample Entropy; SC – Structural coefficients; SEM – Standard error of measurement; SSG – Small-sided games; SWC – Smallest worthwhile changes; USA – United States; VSA – Visual Basic for Applications.
