Background: Advanced maternal age is an important parameter associated with increased risk of feto-maternal complications and it is an evolving trend in the society for the women to plan for pregnancy in late ages. However there are no studies done whether advanced maternal age has its effects on expression of growth pattern in the fetus. So this study was done to compare the maternal age with the third trimester fetal biometric parameters. **Methods:** This study was done in 100 antenatal women and divided into two groups Group 1: optimal maternal age group between 21- 19 years of age and Group 2: Advanced maternal age 30 and above. The pre-pregnant maternal weight, gestational age and third trimester fetal biometrics using ultrasound are noted and compared between the groups. **Results:** The maternal weight gain between the groups was optimal but the third trimester fetal parameters were significantly less in advanced maternal age. The abdominal circumference in optimal age group and head circumference in advanced mater age group was closer to calculated EDD and would be specific in calculating the gestational age. **Conclusions:** Though there is no significant difference in maternal weight gain, there are fetal growth restrictions in advanced maternal age group due to which the third trimester fetal parameters are lesser than the optimal age group. Head circumference would be specific in calculating the estimated date of delivery in advanced maternal age group.

Abstract

Background: Advanced maternal age is an important parameter associated with increased risk of feto-maternal complications and it is an evolving trend in the society for the women to plan for pregnancy in late ages. However there are no studies done whether advanced

41 maternal age
42 has its effects on expression of growth pattern in the fetus. So this study was done to
43 compare the
44 maternal age with the third trimester fetal biometric parameters.

45 **Methods:** This study was done in 100 antenatal women and divided into two groups
46 Group 1:

47 optimal maternal age group between 21- 30 years of age and Group 2: advanced maternal
48 age

49 above 30 years. The pre-pregnant maternal weight, gestational age and third trimester fetal
50 biometrics using ultrasound are noted and compared between the groups.

51 **Results:** The maternal weight gain between the groups was optimal but the third trimester
52 fetal

53 parameters were significantly less in advanced maternal age. The abdominal
54 circumference in

55
56

57 optimal age group and head circumference in advanced maternal age group were closer
58 to
59 calculated EDD and would be specific in calculating the gestational age.

60 **Conclusions:** This study concludes there is some significant fetal growth difference in
61 optimal and advanced maternal age group. There are some fetal growth restrictions in
62 advanced

63 maternal age group fetal parameters but not significant. These findings can open an
64 insight in
65 age related fetal growth and its related complications in future.

66 **Keyword:** Biometry, fetal development, gestational age, prenatal ultrasonography and
67 third trimester

68

69 **Introduction**

70 A full term pregnancy lasts upto around 40 weeks from the first day of mother's last
71 menstrual

72 period (LMP) to the birth of the baby. It is divided into three stages, called
73 trimesters: first

74 trimester, second trimester, and third trimester. Conception to about the 12th week of
75 pregnancy

76 marks the first trimester. The second trimester is 13 to 27 weeks, and the third
77 trimester starts

78 about 28 weeks and lasts until birth. In obstetric practice, Antenatal ultrasonography
79 plays a very

80 important role in assessing the fetal growth by determining the gestational age using
81 biparietal

82 diameter (BPD), head circumference (HC), abdominal circumference (AC) and
83 femur length

84 (FL). Hadlock values were commonly being used as reference charts in the ultrasound
85 machine

86 and most widely accepted for biometry measurements to calculate estimated fetal weight
87 (*Lalitha*

88 *et. al., 2016*).

89 Fetal growth is influenced by many factors such as race, socioeconomic status,
90 genetics,
91 geographical location, maternal diseases, and number of babies (*Adiri et al., 2015*). The
92 maternal
93 pre-pregnancy weight is important for fetal growth indicating body mass index (BMI)
94 and parity
95 determines fetal weight and growth (*Kirchengast., 2009*). Studies have been done
96 and
97 showed an association between pre-pregnancy maternal weight and fetal growth
98 with
99 mothers of less pregnancy weight gain linked to smaller second and third trimester
100 placental
101 weight and fetal size especially between 28 to 32 weeks. It is understood that
102 development of
103 fetal body structures such as head, femur and abdomen correlates with the general fetal
104 size and
105 weight (*Erezih et al., 2017*). Maternal age is very important parameter because
106 childbirth at a
107 young age (adolescent) and advanced age is associated with increased risk of adverse
108 maternal
109 perinatal outcomes, such as postpartum hemorrhage, eclampsia, and cephalopelvic
110 disproportion,
111 as well as adverse infant outcomes including preterm birth, poor fetal growth, low birth
112 weight,

113
114
115 and neonatal mortality (*Khalil et al., 2013*). Thus the advanced maternal age antenatal
116 women
117 needed complete maternal and fetal surveillance for any birth related or fetal
118 complications. Most complications remain independent of important known
119 confounders
120 such as poverty, inadequate prenatal care and/or weight gain during pregnancy
121 (*Cavazos-Rehg et al., 2015*). All these previous findings show an importance of
122 maternal age
123 in general fetal growth pattern and its related complications. However there are lots
124 of studies
125 done to correlate complications related to advanced maternal age but there are no
126 studies to compare the significant fetal growth differences in advanced
127 antenatal
128 women without any complications. If there are significant differences in babies born to
129 advanced maternal age that may have an impact on growth and its well being in the
130 society.
131 So this study was done to compare the third trimester fetal biometric parameters,
132 gestational age
133 and weight gain between the maternal ages.

134

135 **Materials & Methods**

136 This cross sectional study was conducted in the 100 third trimester antenatal
137 women 32-34
138 weeks gestational age attending the Obstetrics O.P.D in All India Institute of Medical
139 Sciences,
140 Mangalagiri, Andhra Pradesh, India during the period of February 2021 to
141 August 2021
142 (AIIMS/MG//IEC/2020-21/71). The samples were divided into two groups; Group 1
143 Optimal age
144 group (n=77) maternal age between 20 to 30years and group 2 advanced age (n=23)
145 with
146 Maternal age 30years and above attending AIIMS, Mangalagiri O.P.D during their
147 routine
148 follow up. The antenatal women with natural conception of pregnancy who had
149 previous

150 regular menstrual cycles and well known last menstrual period (LMP) willing to
151 participate
152 in this study were included. The antenatal women not willing to participate and with
153 any
154 medical and surgical conditions associated with pregnancy like diabetes, hypertension
155 etc.,
156 consumption of alcohol, chewing of tobacco, smoking, assisted reproductive techniques
157 were
158 excluded from the study. The details of the study were explained and written consent
159 was
160 Obtained. Gestational age, pre-pregnant maternal weight and trans-abdominal
161 ultrasound measurements of head circumference, abdominal circumference, femur
162 length,
163 biparietal diameter and estimated fetal weight were noted and tabulated. If the pre-
164 pregnant
165 weight is not known then first trimester weight is noted as pre-pregnant weight and
166 weight gain
167 is calculated accordingly. The maternal age and fetal parameters were summarized as
168 mean and
169 standard deviation. The student t test was utilized for mean
170 comparisons
171 and categorical variables like maternal education and occupation status were

172
173
174 summarized as frequency and proportion. The comparison between maternal age
175 and fetal
176 parameters were analyzed using Pearson or spearman's correlation based on normality. P
177 value less
178 than 0.05 is taken as significant.

179

180 **Results**

181 The mean (SD) age of the antenatal women were 23 (3.1) years and 32.8 (1.8)
182 years in

183 optimal and advanced maternal age group respectively. Most of the study
184 participants were

185 primigravida in both groups 48% and 43%, followed by second gravida (31.2%) in
186 optimal

187 maternal age group and third gravid (34.8%) in advanced maternal age group. This
188 difference

189 does not have statistical significance (Table 1).

190 **Maternal weight gain:**

191 The mean (SD) first trimester weight of study participants was 62.6 (6.6) Kg in optimal
192 maternal

193 age group and 58.6 (11.2) Kg in advanced maternal age group. The mean (SD) weight
194 gain in

195 both groups were 8.5 (3.5) Kg and 8.7 (3.5) Kg respectively. The weight gain
196 was not

197 statistically different between the study groups. The mean (SD) gestational age as per
198 LMP of

199 optimal maternal age was 32.6 (1.7) which was statistically (p value=0.015) lower than
200 the mean

201 (SD) gestational age of advanced maternal age 33.6 (1.6) (Table 1) (Figure 1 & 2).

202 **Third trimester fetal parameters and gestational age estimation:**

203 The mean (SD) of head circumference, abdomen circumference, femoral length,
204 biparietal

205 diameter and estimated fetal weight were significantly lesser in advanced maternal
206 age group

207 (Table 2). The mean (SD) gestational age as per LMP was 228.2(12.2) days, as
208 per head

209 circumference 239.5(12.2) days, as per abdomen circumference 231.8(13.1) days, as per
210 femoral
211 length 233.7(12.1) days and as per biparietal diameter was 233.1(11.8) days in optimal
212 maternal
213 age. Among the advanced maternal age the mean (SD) gestational age as per
214 LMP was
215 235.3(11.6) days, as per head circumference 231.7(12.7) days, as per abdomen
216 circumference
217 223.7(13.2) days, as per femoral length 226.4(13.1) days and as per biparietal
218 diameter
219 225.7(9.9) days (Table 3). The gestational age as per LMP was statistically higher
220 (p-value=
221 0.016) in advanced maternal age group compared to optimal maternal age group.
222 Whereas the
223 gestational age as per fetal third trimester parameters were statistically lower in
224 advanced
225 maternal age years group.
226 The median (IQR) difference in gestational age estimation using LMP and as
227 per head
228 circumference, abdomen circumference, femoral length, biparietal diameter was -
229 12.5(-22.5 to

230
231
232 1.0) days, -3(-16.5 to 10.5) days, -5(-19 to 8) days and -7(-17 to 6) days respectively in
233 maternal
234 age <30 years group. The median (IQR) difference in gestational age estimation using
235 LMP and
236 as per head circumference, abdomen circumference, femoral length, biparietal diameter
237 was 5(-
238 15 to 17) days, -314 (-1 to 25) days, 10(-3 to 23) days and 12(-3 to 20) days
239 respectively in
240 maternal age ≥30 years group (Table 4). The difference in age estimation using LMP
241 and fetal
242 parameter were significantly different between both groups.

243

244 **Discussion**

245 Female fertility in the entire reproductive life span differs with ages, during adolescent
246 ages there

247 will be anovulatory cycles followed by peak ovulatory cycles between 20 to 30 years
248 and finally

249 declining slowly after thirties (*Balash., 2010*). The probability of successful pregnancy
250 is

251 low at the beginning and slowly decreases after the increasing age after a period of
252 optimal

253 fertility. There are various studies showing advanced maternal age associated with
254 range of

255 adverse outcomes in pregnancy like low birth weight (*Jolly et al., 2000*), pre-term birth,
256 still birth

257 (*Flenady et al., 2011*), small for gestational age (*Virginia et al., 2001*),
258 macrosomic babies

259 (*Kenny LC et al., 2013*), increased rates of caesarean section (*Janssens et al., 2008*),
260 hypertensive

261 syndromes and gestational diabetes (*Hsieh et al., 2010*). Evidences from these
262 previous studies

263 shows the optimal age for child bearing in between 21-29 years of age with high
264 consumption

265 rate and lowest adverse events. There is a trend in recent working women to
266 postpone the

267 pregnancy to mid thirties despite of these facts and evidences had laid importance in
268 finding

269 significant fetal growth pattern in normal pregnancies. This is the first study to
270 analyze the

271 impact of maternal age with the fetal growth patterns using third trimester fetal
272 measurement.

273 Also the fetal growth is associated with maternal somatic parameters like pre-pregnant
274 weight

275 and gestational weight gain have been recorded in this study.

276 **Fetal biometry and Gestational age:**

277 The mean gestational age for optimal maternal age group and advanced age group was
278 32 weeks

279 and 33 weeks respectively (**Table 1**). There were significant differences in the third
280 trimester

281 fetal biometric measurements between the two maternal age groups (**Table 2**).
282 The fetal

283 parameters like head circumference, abdominal circumference, femur length, biparietal
284 diameter

285 and fetal weight was significantly more in optimal maternal age group and
286 significantly less in

287 advanced age group. These findings are in accordance with (*Metcalfe et al. 2013*)
288 where the

289
290
291 mean crown rump length in first trimester was significantly less in advanced maternal
292 age and
293 (*Blomberg et al. 2014*) where mean birth weight was significantly decreased in
294 advanced
295 maternal age group. The appropriate biological explanation for this less fetal
296 biometry in
297 advanced maternal age may be due to accelerated placental aging and increased
298 oxidative stress
299 (*Lean et al., 2014*) leading to changes in placental vasculature and myometrial spiral
300 arteries
301 leading to decreased blood flow to placenta, uteroplacental under perfusion and placental
302 infarcts
303 making difficult for the older women to adapt the increased demands of
304 pregnancy. Also
305 increasing maternal age is associated with increased placental weight which may be
306 due to
307 compensatory mechanism for placental dysfunction to balance the reduced
308 uteroplacental blood
309 flow to prevent fetal hypoxia (*Care et al., 2017, Torres et al., 2015*). Head
310 circumference of the
311 fetus is very important fetal biometry which indirectly correlates with the brain
312 development.
313 This association of advanced maternal age with significantly less head circumference
314 suggests
315 significant less brain growth and further the child neurodevelopment profile has to be
316 studied.
317 The exact mechanism of different fetal growth pattern in optimal and advanced
318 maternal age
319 group has to study further and analyzed. It has been speculated that lower fetal growth
320 pattern in
321 advanced maternal age may be due to less effective nutrient partitioning or transfer of
322 nutrients
323 to the fetus (*Fall et al., 2015*).
324 **Maternal weight gain:**
325 In this study there was weight gain upto 8 Kg in both the groups indicating optimal

326 weight gain
327 during the entire pregnancy and there were no significant differences in both the groups
328 **(Table**
329 **1) (Figure 1 & 2).** The mean first trimester weight was around 62kg in optimal age
330 group and 58
331 kg in advanced age group and all the antenatal women were of normal Indian women
332 weight.
333 The optimal weight gain during the entire pregnancy is between 7 to 15 kg if it is more
334 than 15
335 kg it is excess weight gain leading to macrosomia and preterm birth and if it is less
336 than 7 kg
337 leads to low birth weight and preterm delivery (*Luke et al., 2007*). Even though there
338 was no
339 significant difference in the maternal weight gain between the groups the fetal
340 biometry and
341 growth was significantly less in advanced maternal age group extending further to
342 leans about
343 various factors that might lead to uteroplacental insufficiency resulting in this findings.
344 Maternal
345 age is the important risk factor for the pregnancy weight gain which may lead to
346 overweight and
347 this may trigger gestational diabetes mellitus, macrosomia leading to preterm birth
348 and other
349 adverse pregnancy outcomes (*Yang et al., 2015*).

350
351

352 **Estimated gestational age:**

353 According to calculated estimated date of delivery (EDD) from last menstrual period
354 (LMP) and

355 the estimated gestational age from various third trimester fetal biometric
356 parameters were

357 compared for any significant differences (**Table 3 & 4**). In this study there were
358 significant

359 differences with all third trimester fetal parameters in calculating the gestational age
360 between the

361 groups. The abdominal circumference was very much significant and approximate
362 to LMP

363 calculated EDD in the optimal maternal age and head circumference was very much
364 near to

365 calculated EDD in advanced maternal age group. So the abdominal circumference in
366 optimal age

367 group and head circumference in advanced mater age group would be specific in
368 calculating the

369 gestational age and to plan for parturition in cases where the LMP is not known.
370 Karki et al.,

371 2006 conducted study in antenatal women starting from first trimester till the birth and
372 found

373 during first trimester crown rump length (CRL) is the best fetal parameter
374 correlating

375 with the gestational age and in second trimester abdominal circumference best
376 correlating

377 with the gestational age. During third trimester it is the head circumference that
378 correlates best

379 with the gestational age (*Karki et al., 2006*). However that study was not specific
380 to

381 maternal age correlating the fetal gestational age. Considering all these facts advanced
382 maternal

383 age can have complications starting from fertility, first trimester, third trimester,
384 labor,

385 perinatal mortality, postpartal mortality and chromosomal and genetic disorders of the
386 fetus and

387 appropriate care and diagnostic test must be done at regular period of time to prevent all
388 these
389 complications (*Ales et al., 1990*)

390

391 **Conclusion:**

392 This study had compared the third trimester fetal biometric parameters and weight
393 gain of

394 antenatal women between the maternal age group. This study concludes that
395 there were

396 significant restrictions in fetal growth parameters of advanced maternal age group.
397 This could

398 result a great impact in the further growth and development of child in the society.
399 Also there

400 were no significant differences in weight gain between the antenatal women of
401 different age

402 groups. Furthermore the abdominal circumference in the optimal maternal age
403 and head

404 circumference in the advanced maternal age were more near to gestational age
405 and to the

406 expected date of delivery. Thus not only maternal weight determines the fetal growth,
407 maternal

408 age is important in healthy fetal growth.

Figure 1

Figure 1: Maternal weight in first and trimester of study participants in maternal age <30 years group

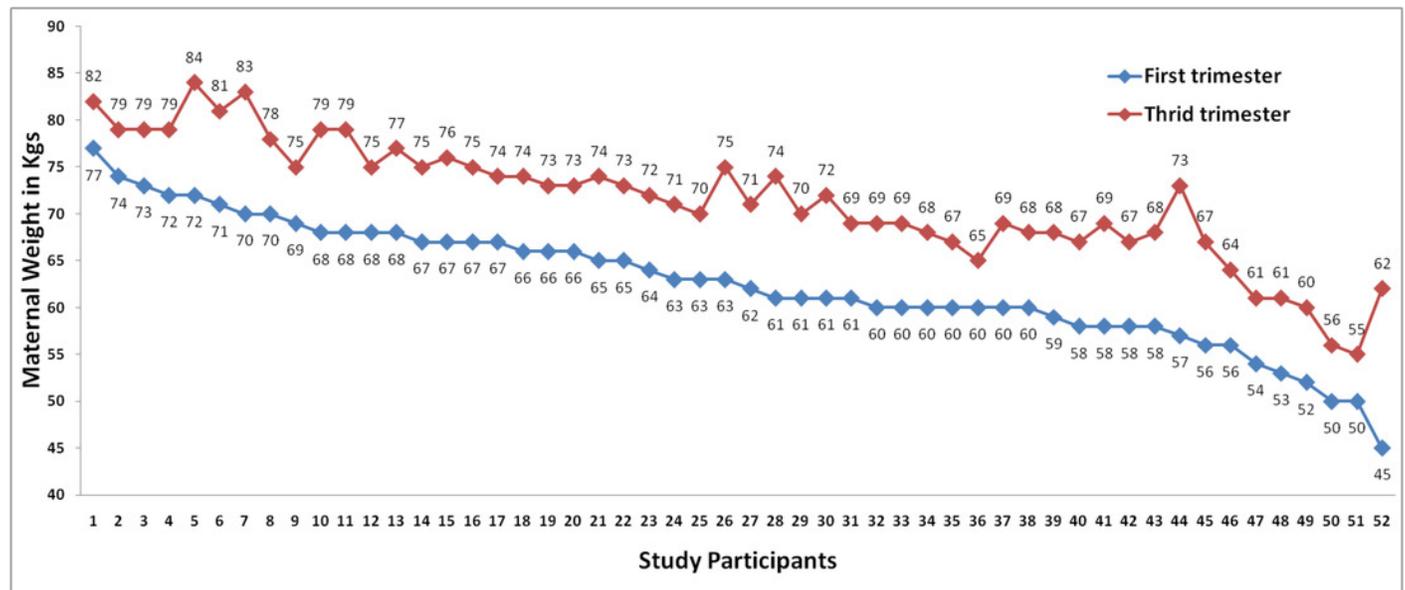

Figure 2

Figure 2: Maternal weight in first and trimester of study participants in maternal age ≥ 30 years group

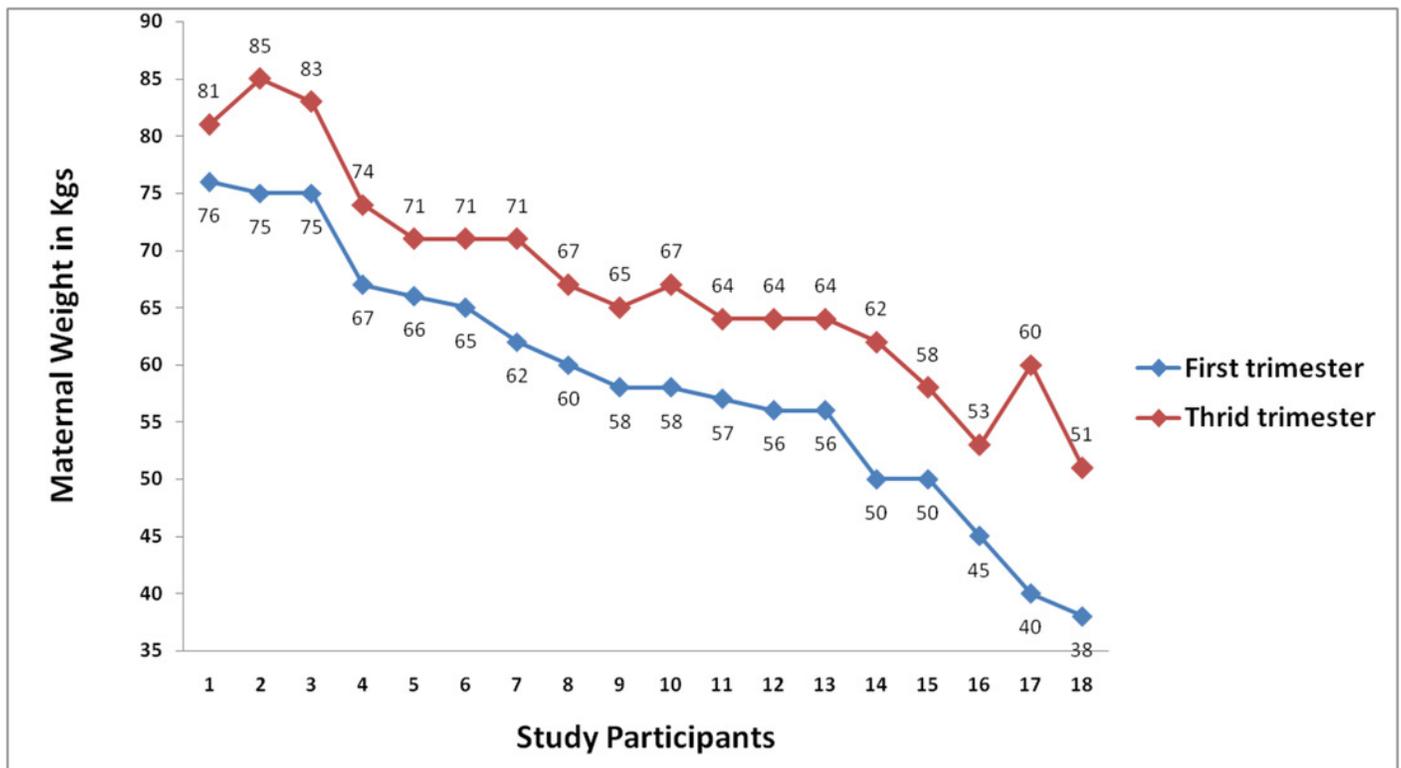

Table 1 (on next page)

Maternal age, Parity, weight gain and Gestational age between the two groups.

Distribution of basic details of study participants

Distribution of basic details of study participants

Item		Maternal Age <30 years Group N=77	Maternal Age ≥30 years Group N=23	p-value
Maternal Age in years	Mean(SD)	23.2(3.1)	31.8(1.8)	<0.001*
Birth Order N(%)	1	37(48.1)	10(43.5)	0.355
	2	24(31.2)	5(21.7)	
	≥3	16(20.8)	8(34.8)	
First Trimester weight	Mean(SD) in Kg	62.6(6.6)	58.6(11.2)	0.074
Weight Gain	Mean(SD) in Kg	8.5(3.5)	8.7(3.5)	0.789
Gestational age As Per LMP	Mean(SD) in weeks	32.6(1.7)	33.6(1.6)	0.015*

Table 1: Maternal age, Parity, weight gain and Gestational age between the two groups.

Table 2 (on next page)

Comparison of third trimester fetal biometric parameters between the two maternal age groups.

Fetal Parameter of study participants

Fetal Parameter of study participants

Fetal Parameters	Maternal Age <30 years Group N=77	Maternal Age ≥30 years Group N=23	p-value
Head Circumference Mean(SD) Millimeter	306.6(12.5)	298.2(13.6)	0.007*
Abdomen Circumference Mean(SD) Millimeter	290.4(19.8)	278(19.7)	0.017*
Femoral Length Mean(SD) Millimeter	64.6(3.7)	62.4(4.1)	0.019*
Biparietal Diameter Mean(SD) Millimeter	82.9(3.9)	80.4(3.4)	0.006*
Estimated Fetal Weight Mean(SD) Gram	2191.2(385.8)	1944(382.2)	0.010*

Table 2: Comparison of third trimester fetal biometric parameters between the two maternal age groups.

Table 3 (on next page)

Gestational age estimation using fetal biometric parameters and comparison between maternal age group.

Gestational age estimation using various parameters of Study participants

1 **Gestational age estimation using various parameters of Study participants**

2

Gestational age	Maternal Age <30 years Group N=77	Maternal Age ≥30 years Group N=23	p-value
As Per LMP Mean(SD) Days	228.2(12.2)	235.3(11.6)	0.016*
As per Head Circumference Mean(SD) Days	239.5(12.2)	231.7(12.7)	0.008*
As per Abdomen Circumference Mean(SD) Days	231.8(13.1)	223.7(13.2)	0.009*
As Per Femoral Length Mean(SD) Days	233.7(12.1)	226.4(13.1)	0.010*
As Per Biparietal Diameter Mean(SD) Days	233.1(11.8)	225.7(9.9)	0.015*

3

4 **Table 3: Gestational age estimation using fetal biometric parameters and comparison**
5 **between maternal age group.**

6

Table 4(on next page)

Differences between gestational age of EDD and fetal biometry and compared between the maternal ages

Difference in Gestational age estimation of Study participants

1 **Difference in Gestational age estimation of Study participants**

2

Difference in Gestational age	Maternal Age <30 years Group N=77	Maternal Age ≥30 years Group N=23	p-value
Head Circumference Median(IQR) Days	-12.5(-22.5 to 1.0)	5(-15 to 17)	<0.001*
Abdomen Circumference Median(IQR) Days	-3(-16.5 to 10.5)	14(-1 to 25)	<0.001*
Femoral Length Median(IQR) Days	-5(-19 to 8)	10(-3 to 23)	<0.001*
Biparietal Diameter Median(IQR) Days	-7(-17 to 6)	12(-3 to 20)	<0.001*
