

GENERAL COMMENTS

As the only statistical point of criticism, "The Pearson correlation between leaves and roots at different growth stages in 2018 and 2019 was found to be statistically significant." this is expression. Since the Pearson correlation is statistically significant, it cannot be excluded from the statistical model. Nevertheless, I congratulate the authors for all the editing and development of their manuscript.

Acceptance is appropriate as it provides a sufficient improvement in the statistical analysis of the manuscript and, accordingly, in the organization of comments.
