

Basic reporting

The authors provided clear responses to the previously mentioned comments, addressing each one comprehensively. However, they have yet to address the following comment:

7.- (Fig. 2A) Does MAC at 0.05 and 0.1C promote biofilm formation? What is the fundament behind this MAC effect? It is recommended to describe and discuss this MAC effect.

I consider the complete description of this result (Fig. 2A) and its corresponding discussion to be indispensable for understanding the antibiofilm effect conferred by MAC. This result highlights that applying MAC treatment at low concentrations promotes biofilm formation. Does this hold any clinical significance?

Experimental design

The changes applied to the Experimental design are appropriate.

Validity of the findings

The authors speculate that MAC treatment may inhibit tyrosine kinases among other potential aspects. However, it is advisable to incorporate relevant citations from the bibliography to support this discussion.
