**Background.** Appearance anxiety is a popular topic in adolescence. Adolescents tend to be more sensitive to their appearance, and may be at higher risk for depression. However, few studies have revealed the mechanisms linking appearance anxiety and depression among medical college students. This study aimed to explore the multiple mediating roles of interpersonal sensitivity and social support between appearance anxiety and depression among medical college students. **Methods.** A total of 737 participants took part in the survey. With invalid 13 invalid samples excluded, 724 college students completed questionnaires containing basic demographic characteristics, Appearance Anxiety Scale, Interpersonal Sensitivity Scale, Perceived Social Support Scale, and Depression Scale. The average age of 724 samples is  $19.8 \pm 2.02$  including freshman to senior year and graduate school and above; 31.9% of the participants were male and 68.1% were female. Hayes' PROCESS macro is used for SPSS. **Results.** Appearance anxiety can not only directly affect depression, but also indirectly affect depression through three significant mediating pathways: (1) IS ( $B=0.106$ , 95% CI [0.082-0.132]), which accounted for 49.77% of the total effect, (2) SS ( $B=0.018$ , 95% CI [0.008-0.031]), which accounted for 8.45% of the total effect, and (3) IS and SS ( $B=0.008$ , 95% CI [0.003-0.014]), which accounted for 3.76% of the total effect. The total mediating effect was 61.97%. **Limitations.** It is a cross-sectional research method and the causal relationship is unclear. **Conclusions.** This study found that lower interpersonal sensitivity and higher social support can effectively reduce depression caused by appearance anxiety among college students. The schools and relevant departments should take measures to reduce the interpersonal sensitivity of college students and establish reliable social support, so as to reduce the occurrence of

depression.

## 20 Abstract

21 **Background.** Appearance anxiety is a popular topic in adolescence. Adolescents tend to be more  
22 sensitive to their appearance, and may be at higher risk for depression. However, few studies  
23 have revealed the mechanisms linking appearance anxiety and depression among medical college  
24 students. This study aimed to explore the multiple mediating roles of interpersonal sensitivity  
25 and social support between appearance anxiety and depression among medical college students.  
26 **Methods.** A total of 737 participants took part in the survey. With invalid 13 invalid samples  
27 excluded, 724 college students completed questionnaires containing basic demographic  
28 characteristics, Appearance Anxiety Scale, Interpersonal Sensitivity Scale, Perceived Social  
29 Support Scale, and Depression Scale. The average age of 724 samples is  $19.8 \pm 2.02$  including  
30 freshman to senior year and graduate school and above; 31.9% of the participants were male and  
31 68.1% were female. Hayes' PROCESS macro is used for SPSS. **Results.** Appearance anxiety can  
32 not only directly affect depression, but also indirectly affect depression through three significant  
33 mediating pathways: (1) IS ( $B=0.106$ , 95% CI [0.082-0.132]), which accounted for 49.77% of  
34 the total effect, (2) SS ( $B=0.018$ , 95% CI [0.008-0.031]), which accounted for 8.45% of the total  
35 effect, and (3) IS and SS ( $B=0.008$ , 95% CI [0.003-0.014]), which accounted for 3.76% of the  
36 total effect. The total mediating effect was 61.97%. **Limitations.** It is a cross-sectional research  
37 method and the causal relationship is unclear. **Conclusions.** This study found that lower  
38 interpersonal sensitivity and higher social support can effectively reduce depression caused by  
39 appearance anxiety among college students. The schools and relevant departments should take  
40 measures to reduce the interpersonal sensitivity of college students and establish reliable social  
41 support, so as to reduce the occurrence of depression.

## 46 Introduction

47 Depression is an important public health problem that affects more than 300 million people  
48 worldwide. The prevalence of depression in college students was significantly higher than that of  
49 middle and elementary school students[1], especially in the medical college. Study has  
50 demonstrated that about 22% of college students in China suffer from depression[1], and the  
51 prevalence of depression among Chinese medical students is 27%[2]. So this shows that college  
52 students have an increasing risk of depression than others. Depression and anxiety are  
53 multifactorial and complex psychological problems with possible risk factors including  
54 psychological, academic, biological, lifestyle, social and economic. In psychology, for example,  
55 students with higher neurotic and more introverted are more likely to be depressed from  
56 psychological view. Multiple college-related poor lifestyles such as smoking, drinking, and  
57 substance abuse also increase the risk of depression among college students. Having a supportive  
58 social network, like family and friendships, can also influence a student's mood and reduce the  
59 likelihood of depression. If suffering from depression, students, especially medical students, are

60 more likely to give up solving complex problems and feeling confused during their study[3-5].  
61 These behaviors may lead to hypertension, obesity, diabetes and other diseases in the future,  
62 which seriously reduce the quality of life and increase the economic burden[6] More importantly,  
63 the global suicide rate caused by depression is increasing every year and depression is a major  
64 risk factor for adolescents' suicide[3]. According to existing studies, although there are many  
65 factors influence adolescents' depression, such as anxiety, appearance satisfaction, interpersonal  
66 sensitivity, and social support, the complex relationships among the influencing factors are still  
67 unclear and need to be further investigated[7-10]. Adolescence is a time when individuals go  
68 through major physical and psychological changes as they grow up, during which adolescents  
69 pay special attentions to their image and are susceptible to the influence of the mass media's  
70 aesthetic standards for appearance and figure, etc. If they realize that they do not meet such  
71 standard, they are prone to appearance anxiety, which is likely to lead to further depression.[11]

72 Appearance anxiety (AA) refers to a condition when an individual is overly concerned  
73 about their appearance. They may become inconfident and anxious about their appearance when  
74 they perceive social standards or poor evaluations of themselves from others[12].With the  
75 increasing rate of science and technology development, various social platforms and media have  
76 become flourishing and have been invading in college students' lives[13]. They gradually begin  
77 to pay excessive attention to their appearance and worry about others' evaluation about their  
78 appearance. And these may even trigger their anxiety[14]. Some studies have pointed out that  
79 adolescence is a time in human development when they go through drastic physical and  
80 psychological changes. During adolescence, students pay more attention to their looks and are  
81 always unconsciously exposed to unrealistic standards of beauty, appearance or body type from  
82 the mass media. Their self-esteem probably declines if they think that they do not meet these  
83 standards, resulting in anxiety and depression[15]. Appearance influence the formation and  
84 establishment of self-esteem in adolescence and young adulthood. Anxiety about appearance  
85 make them to become negative due to lack of confidence, which leads to a decrease in the level  
86 of self-esteem of the individual[11], resulting in an inability to integrate into society and to  
87 positively face the challenges of interpersonal relationships. Therefore, it is necessary to make a  
88 further study on the effect of AA on depression among medical college students in order to  
89 explore ways to reduce the rate of depression among them. Advances in a cognitive behavioral  
90 model of body dysmorphic disorder proposed that when individuals compare themselves to the  
91 least likely ideal appearance, they generates negative emotions, which lead to self-protective  
92 behaviors such as avoidance[16, 17]. Some adolescents may be bullied, harassed, and ridiculed  
93 because of their appearance, which exacerbates adolescents' AA and gradually develops distorted  
94 perceptions and aversion to their own appearance[17, 18]. When adolescents compare  
95 themselves upward with others or compare their ideal selves with their real-life selves, a  
96 discrepancy is created, which can lead to emotional vulnerability, anxiety and exacerbate  
97 depression[19, 20]. Anabolic-androgenic steroid users are at greater risk of depression if they  
98 have defective appearances[21]; Dissatisfaction with physical appearance can act as a mediator  
99 to influence the relationship between self-esteem and depression[7]. Appearance influences the

100 formation and establishment of self-esteem in adolescence and young adulthood. External  
101 anxiety can lead to a lack of confidence and negativity and further a decrease in an individual's  
102 level of self-esteem, resulting in an inability to integrate into society and positively face the  
103 challenges of interpersonal relationships[22]. Hairi et al. found that a person's dissatisfaction  
104 with his or her appearance can lead to lowered self-esteem, which in turn can trigger  
105 depression[15]. A study in Coimbatore showed that 77.6% of college women were dissatisfied  
106 with their body image and that depression was significantly associated with it[23]. At the same  
107 time, anxiety and depression are closely related--they are comorbidity, and anxiety is a risk  
108 factor for depression[24]. Studies have demonstrated that elevated levels of anxiety are  
109 associated with depression among college students in Latin America[10]. Based on existing  
110 studies, it can be reasonably speculated that medical college students' dissatisfaction with their  
111 appearance is likely to cause AA, which in turn increases the likelihood of depression.

112 Interpersonal sensitivity (IS) is one of the mental health problems faced by contemporary  
113 college students[25]. IS was first proposed by Boyce and Parker and is considered as a  
114 personality trait that usually manifests itself as an over-understanding of the behavior and  
115 emotions of others[26]. Individuals sometimes pay too much attention to their own  
116 relationships and fear the rejection or criticism of others in social interactions, which is also  
117 a symptom of IS[8]. Discomfort and anxiety will happen in people with IS trait when they are  
118 interacting with people. Such discomfort leads to social anxiety and a strong sense of low-  
119 esteem, making individuals vulnerable to develop into depression. They also often change their  
120 behavior to conform to the expectations and ideas of others[27, 28]. Some researchers have used  
121 structural equation modeling to show that IS moderates anxiety states in participants who are  
122 abused as children, and that also moderates AA in adolescents[29, 30]. Among Chinese college  
123 students, negative emotion is related to IS and is one of the predictors of depression[8, 25].  
124 Whether IS can be used as a mediating variable to moderate the relationship between AA and  
125 depression among college students needs to be validated through further research.

126 Social support (SS) refers to a social network of family, friends, teachers and classmates  
127 that provides emotional support and practical help to individuals[31]. When encountering  
128 difficulties, college students can seek help from family, friends, etc., so as to obtain solutions to  
129 problems, which greatly relieves physical and mental stress[8]. Therefore, SS is a key factor in  
130 the mental health of college students and makes an important contribution to the mental health of  
131 adolescents[32, 33]. Peirce et al. constructed a model based on social support theory and found  
132 that SS was negatively associated with depression[34]; Study made by Jaycox et al. reported an  
133 effect of social interaction on depression in adolescents[35]. SS can significantly reduce the  
134 anxiety levels of community residents during the COVID-19 outbreak in Turkey in 2020[36].  
135 Body image and SS in patients with Psoriasis were found to be major contributors to  
136 depression[37]. Meanwhile, SS plays an important role in reducing depressive symptoms and IS,  
137 and higher levels of SS can reduce the severity of an individual's depressive symptoms and  
138 IS[38].

139 Based on the available studies, it can be speculated that there is some relationship between  
140 AA, IS, SS and depression. There are few studies on the mechanisms between AA and  
141 depression among Chinese college students, studying in a medical school, and there is a lack of  
142 studies demonstrating the mediating role of IS and SS in the relationship between AA and  
143 depression. Therefore, this study aimed to investigate the relationship between AA, IS, SS, and  
144 depression, as well as to explore the multiple mediating roles of IS and SS between AA and  
145 depression in medical college students. The purpose of this study is to reach a deeper  
146 understanding of the factors influencing depression and to provide a theoretical basis for the  
147 development of public health policies in relevant sectors. This is also to prevent depression at the  
148 source, consciously reduce the risk of depression among medical college students and maintain  
149 their physical and mental health at a high level. Based on the above, the following three  
150 hypotheses are proposed:

151 H1: AA positively predicts depression among college students studying in a medical school.

152 H2: AA indirectly predicts depression through high IS among college students studying in a  
153 medical school.

154 H3: AA indirectly predicts depression through low SS among college students studying in a  
155 medical school.

156 H4: AA indirectly predicts depression through high IS and low SS among college students  
157 studying in a medical school.

158

## 159 **Materials & Methods**

### 160 2.1. Participants and Procedure

161 This study adopted a cross-sectional survey. From February 2 to February 5, 2023, a  
162 convenience sampling was used to recruit 737 college students for questionnaire survey at  
163 Chongqing Medical University. Posters, applets, QR codes, and links are utilized to disseminate  
164 and recruit research subjects. The inclusion criteria for this study were students who were  
165 enrolled in Chongqing Medical University (including undergraduate, graduate and doctoral  
166 students ) and were willing to participate in this study. Respondents were briefed by professional  
167 investigators on the survey content and purpose prior to the survey to seek informed consent. If  
168 the subject is underage, investigators obtained informed consent from their guardians via the  
169 Internet in advance. The questionnaire included the Basic demographic variables, the  
170 Appearance Anxiety Scale-Brief Version (AASBV), the Perceived Social Support Scale (PSSS),  
171 the SCL-90 Interpersonal Sensitivity Subscale and the Patient Health Questionnaire(PHQ-9).  
172 The questionnaires were distributed and collected relying on the Questionnaire Star platform  
173 online. The inclusion criteria were that the results of questionnaires have no missing items,  
174 obvious logical errors and invalid numbers (e.g. the ones whose height are over 2.5m or less than  
175 1m; the ones whose weight are less than 30kg or more than 125kg; the ones whose age are below  
176 16 or bigger than 36). More precisely, all the participants were university students at Chongqing  
177 Medical University and after removing missing and invalid data, the remaining sample size was  
178 724.

179

## 180 2.2. Measurement

## 181 2.2.1. Appearance anxiety

182 Appearance anxiety was measured by the Appearance Anxiety Scale-Brief Version  
183 (AASBV) written by Dion[39]. The Appearance Anxiety Scale-Brief Version consist of 14 items.  
184 A 5-point Likert scale ranging from 1 (never) to 5 (almost always) is used, which reflects the  
185 respondents' combined attitudes toward appearance anxiety with a total score ranging from 14 to  
186 70. The higher the overall score is, the higher the degree of appearance anxiety is[40].The chosen  
187 Chinese version of the Appearance Anxiety Scale is a short version of good reliability and  
188 validity and the Cronbach's alpha measured was 0.876.

189

## 190 2.2.2. Social support

191 The Perceived Social Support Scale (PSSS) is used to measure social support[41]. Response  
192 to an item was measured on a 7-point Likert scale, ranging from 1 (strongly disagree) to 7  
193 (strongly agree). It has 12 items in total, and the total score reflects the total social support felt by  
194 the individual. The scale has three dimensions: family support, friends support, and others  
195 support. The overall score between 12-36 is a low support status; 37-60 is a medium support  
196 status; 61-84 is a high support status; the higher the overall score is, the higher the individual's  
197 social support people have[42]. In this study, the Cronbach's alpha for the scale was 0.930.

198

## 199 2.2.3. Interpersonal sensitivity

200 The Symptom Check List-90 (SCL-90) is used to assess respondents' interpersonal  
201 sensitivity[43]. The SCL-90 invented by Derogatis can be used to assess the intensity of self-  
202 reported symptoms, and the scale contains a number of subscales. The Interpersonal Sensitivity  
203 Subscale (9 items in total), one of the subscales, is used to assess the intensity of interpersonal  
204 sensitivity among students at Chongqing Medical University. Responses to items are measured  
205 on a 5-point Likert scale (0=none 4=critical), with a total score ranging from 0-36. Subscale  
206 score greater than 2 indicates a psychological abnormality[44]. The Cronbach's alpha  
207 measurement for this subscale is 0.855, which is more than 0.8 with high reliability.

208

## 209 2.2.4. Depression

210 The Patient Health Questionnaire (PHQ-9) is used to measure depression[45]. PHQ-9  
211 consists of nine items for depression self-assessment. The efficiency and convenience of the  
212 scale makes itself widely used in real life. It rated on a 4-point Likert scale with a score ranging  
213 from 0 to 3 and a total score range of 0-27 on the scale. The cut-offs have been proposed as 0-4,  
214 5-9, 10-14, 15-19 and 20-27 for no, mild, moderate, moderately severe and severe depression  
215 respectively[46].The Cronbach's alpha for this component in this study was 0.852.

216

## 217 2.3. Statistical Analysis

218 This study used the Statistical Package for the Social Sciences (SPSS) version 25.0 to  
219 analyze the data. Continuous variables are represented using mean and standard deviation  
220 ( $M \pm SD$ ), and categorical variables are expressed as frequency and percentage ( $n(\%)$ ). Normality  
221 test and uniformity of variance test are performed for measurement of AA, IS, SS, and  
222 depression scores under different basic demographic characteristics, and further, a t-test on two  
223 independent samples or variance homogeneity is performed to determine whether there was a  
224 difference in the mean values of AA, IS, SS, and depression between different subgroups when  
225 all samples were satisfied. Pearson's correlation was used to analyze the correlations between the  
226 appearance anxiety, social support, interpersonal sensitivity and depression. To further  
227 understand the relationship between the above variables, a serial multiple mediation model  
228 (model 6) was performed using PROCESS macro 3.5 package provided by Hayes. Gender and  
229 age were used as covariates, appearance anxiety as the independent variable (X), interpersonal  
230 sensitivity and social support as mediating variables (M1, M2) and depression as the dependent  
231 variable (Y). After the model was built, the mediation effects were tested using a bootstrap (5,000  
232 bootstrap samples) based on 95% confidence intervals. If the 95% confidence interval for the  
233 mediating effect does not include zero, the mediating effect will be significant at the 0.05 level.  
234 The model of this study was tested to be significant at the 0.05 level.

235

## 236 Results

### 237 3.1. Basic Demographic Variables

238 All participants were asked to complete a questionnaire that included gender, age, grade,  
239 height, weight, whether they were an only child, whether their home address was town or village,  
240 monthly household income, GPA for the previous school year, and disposable income. Specific  
241 issues and analysis results are shown in Table 1. As shown in Table 1, there are significant  
242 differences in the mean of AA scores across grade levels and BMI index ( $F=3.402$   $P=0.009$ ;  
243  $F=5.752$   $P=0.003$ ). IS scores varied significantly by grade levels, home address, ranking of results  
244 ( $F=2.738$ ,  $P=0.028$ ;  $F=2.113$   $P=0.035$ ;  $F=-2.426$   $P=0.016$ ). The average scores of SS varied  
245 significantly across gender, grade, BMI, only a child, home address, monthly income, ranking of  
246 results, single and discretionary income ( $F=2.228$   $P=0.026$ ;  $F=2.682$   $P=0.031$ ;  $F=3.367$   $P=0.001$ ;  
247  $F=-3.004$   $P=0.003$ ;  $F=-5.289$   $P<0.000$ ;  $F=2.801$   $P=0.005$ ;  $F=1.985$   $P=0.048$ ;  $F=-3.584$   $P<0.000$ ).  
248 The mean of Depression scores varied with grade levels and ranking of results ( $F=2.679$   $P=0.031$ ;  
249  $F=-2.885$   $P=0.004$ ).

250

251

### 252 3.2. Correlation analysis

253 The correlation matrix of key study variables is presented in Table 2. IS and AA were  
254 positively correlated ( $r = 0.568$ ,  $p < 0.01$ ); AA and IS were negatively correlated with SS (AA:  $r$   
255  $= -0.323$ ,  $p < 0.01$ ; IS:  $r = -0.319$ ,  $p < 0.01$ ); AA and IS were positively correlated with  
256 depression (AA:  $r = 0.438$ ,  $p < 0.01$ ; IS:  $r = 0.534$ ,  $p < 0.01$ ), and SS was negatively correlated  
257 with depression ( $r = -0.344$ ,  $p < 0.01$ ).

258

## 259 3.3. Multiple mediation analyses of the hypothesized model

260 A multiple mediation analysis was conducted to explore the mediation effects of IS and SS  
261 in a college student population. Control variables included gender, age, BMI, GPA, being an  
262 only child or not and home address. AA and depression were entered as independent and  
263 dependent variables respectively. The proposed mediators were IS and SS. Results of the  
264 analysis (Table 3) showed that AA was positively correlated with depression (Index = 0.168,  $p <$   
265 0.001). Secondly, AA was positively correlated with IS (Index = 0.575,  $p <$  0.001) and  
266 negatively correlated with SS (Index = -0.234,  $p <$  0.001). IS was negatively correlated with SS  
267 (Index = -0.179,  $p <$  0.001). In addition, IS was positively correlated with depression (Index =  
268 0.384,  $p <$  0.001) and SS and depression were negatively correlated (Index = -0.161,  $p <$  0.001).

269

## 270 3.4. Bootstrap test of mediators

271 The mediation path model is presented in Figure 1. To test the significance of the mediating  
272 effect of IS and SS, a bootstrap estimation procedure with 5,000 bootstrap samples is performed.  
273 The total effect, direct effect, and indirect effect are presented in Table 4. The path coefficients  
274 for the 95% CI of the paths do not include 0 which means that the path coefficient of this path is  
275 significantly true at the level of 0.05. As is shown in Table 4, the significance of the direct effect  
276 of AA on depression (Effect=0.081, 95% CI [0.045-0.117]) remained when the mediators (IS  
277 and SS) were included in the model. AA was found to indirectly affect depression psychological  
278 stress through three significant mediation pathways: (1) IS (B=0.106, 95% CI [0.082-0.132]),  
279 which accounted for 49.77% of the total effect, (2) SS (B=0.018, 95% CI [0.008-0.031]), which  
280 accounted for 8.45% of the total effect, and (3) IS and SS (B=0.008, 95% CI [0.003-0.014]),  
281 which accounted for 3.76% of the total effect. The total mediating effect was 61.97%.

282

283

284 **Discussion**

285 AA has long been a hot topic in young adults. At the stage of physical and mental maturity,  
286 teenagers are delicate and sensitive, and they begin to care about their appearance, but external  
287 pressure on their appearance leads to negative emotions. Liao's research shows that 78.8% of  
288 medical students in China are concerned about their appearance, it shows that the problem of AA  
289 is very serious among medical students, and high AA can lead to social anxiety and depression.  
290 And medical students' focus on weight and figure may be related to AA[47]. This study is the first  
291 to explore the effects of IS and SS on adolescents' AA and depression in a sample of 724 at  
292 Chongqing Medical University in Chongqing, China, and to investigate the effects of SS and IS  
293 as mediating variables on AA and depression mechanism. The results of this study will  
294 contribute to the early detection and timely intervention of depression among medical college  
295 students and contribute to the healthy physical and mental growth of medical college students  
296 studying in medical schools. Moreover, this research can also make up for the research gap in  
297 this area at home and abroad in recent years, so as to have a certain impact on the prevention of

298 mental illness of college students. AA scores vary by grade and BMI, which is possibly because  
299 contemporary society promotes the concept of "thinness" as beauty[47]. It leads students to pay a  
300 lot of attention to their BMI, but further research is needed on the impact of grade level. As  
301 mentioned in previous articles, the increasing of age is likely to lead to increased levels of  
302 AA[48]. IS varies by grade, home address, and grades. Freshmen may be at higher risk of IS  
303 because they have just entered a new environment and are mentally less mature than older  
304 students[49]. SS varies by gender, grade, BMI, only a child, home address, monthly income,  
305 ranking of results, single and discretionary income, and depression by grade and test score.  
306 Especially students who are undergoing graduate exams in their senior year are more likely to  
307 suffer from depression[50].

308 This study found that AA positively and significantly predicted the onset of depression in a  
309 medical college student population, which is consistent with the findings of a study exploring the  
310 relationship between appearance and psychological distress[51]. It is undeniable that appearance  
311 is the most intuitive "first face" in human interaction, people can use make-up to strengthen the  
312 confidence in their appearances, but it is more important to establish the correct concept of  
313 appearance and lessen the chance of AA. Previous studies have found that if they are more  
314 sensitive and attentive to their appearance than others, they may take a higher risk of  
315 depression[51]. Depression is the leading cause of illness and disability among adolescents[52].  
316 It is not that individuals will never have negative emotions such as depression and anxiety  
317 without mental problems at present. Actually, mental health can change. Especially, for example,  
318 in the early days of the exam, the numbers of students with depressive symptoms increase. This  
319 is possibly due to excessive psychological stress and challenges. Facing the exam, they have less  
320 time to unwind and thus psychological problems are exacerbated[50]. Therefore, more attention  
321 should be attached to the mental health of medical students, especially at the examination stage.  
322 The right amount of recreational activities and time with their families should be provided to  
323 students at this stage to increase SS and reduce their depression. When depression occurs during  
324 adolescence, they have a higher rate of recurrence of depression in the future and their quality of  
325 life will be seriously affected, which will increase the economic and health burden of society[6,  
326 53]. In this regard, the corresponding relevant departments (especially schools) should attach  
327 high importance to the occurrence of depression among college students, conduct early mental  
328 health screening in a timely manner, provide additional psychological support to students at risk,  
329 and combine early detection with effective intervention in order to reduce the probability of  
330 college students suffering from depression and aggravation of the condition[5]. At the same time,  
331 actively guiding students to reduce their external evaluations of others, building a good  
332 communication platform, and improving their coping and interpersonal skills can enable students  
333 to receive more campus support.

334 This study shows that IS not only is a mental health problem for medical college students,  
335 but also it has a great potential to affect depression in college students with appearance anxiety.  
336 Medical college students with high IS are overly concerned about the feelings and behaviors of  
337 others and fear negative evaluations and rejections from others, therefore they are

338 psychologically fragile and sensitive. Such students are at high risk of losing themselves and  
339 becoming depressed in order to avoid rejection and criticism. Previous studies have confirmed  
340 that people with IS traits are more likely to develop depression[27]. In this regard, group  
341 counseling has been widely used in intervention studies of interpersonal communication and  
342 prevention of depression among college students with good results, and previous studies have  
343 also confirmed that group sand tray game therapy can effectively reduce IS of college  
344 students[54, 55]. Schools and other relevant departments can learn from the existing studies and  
345 actively carry out activities such as group counseling and group sand tray games to help  
346 individuals reduce IS and the occurrence of depression among college students.

347 This study confirmed the validity of hypothesis 3. SS is an important resilient resource for  
348 individuals in social life and a protective factor for college students' physical and mental  
349 health[56]. The result of this study indicating that higher SS can maintain a good emotional  
350 experience for individuals, enhance the coping and handle ability of college students when  
351 facing AA and reduce the anxiety and depression caused by appearance[57]. Specifically, SS  
352 was negatively correlated with AA, IS, and depression. A decrease in SS can seriously affect  
353 people's psychological state, leading to increase levels of anxiety and depression. As a previous  
354 study shows, people with higher IS have lower SS, so people with higher SS are better able to  
355 face and adapt to relationships[58]. Family and friends should give more love and accompany to  
356 youth who is in sensitive periods, encourage and support them when they suffer setbacks, and  
357 give them timely help when they encounter difficulties. State authorities should also give high  
358 priority to the occurrence and treatment to depression among college students, help youth receive  
359 reliable support and the benefits they deserve. and build a good platform to improve their coping  
360 ability and interpersonal skills.

361 Findings in this study enriched the mediating influences of AA leading to depression:  
362 college students with AA faced with higher SS or lower IS would reduce the occurrence of  
363 depression. Also, the results found that IS was significantly and negatively correlated with SS  
364 ( $r=-0.319$ ,  $p<0.01$ ), meaning that among college students with AA, those with lower IS received  
365 more SS and thus reduced the incidence of depression. College students, especially medical  
366 school students, are the backbone of social construction and development in the future. Although  
367 youth is often considered to be the best stage of health, this is by no means a reason to neglect  
368 the physical and mental health of college students. All departments should take active measures  
369 to attach great importance to the physical and mental health of college students studying in a  
370 medical school and draw a blueprint for a healthy and happy future together.

371

## 372 **Limitations**

373 Although all the hypotheses in the study are valid, the limitations in the study must also be  
374 acknowledged. Firstly, it is a cross-sectional research method and the causal relationship among  
375 AA, IS, SS and depression is unclear. So the longitudinal studies could be conducted on the basis  
376 of this study to further explore the causal relationships between variables. Secondly, the study  
377 was conducted about three months after the strictly prevention and control of COVID-19 has

378 been lifted in China, and because of the wearing of masks, people's anxiety about their  
379 appearance may change, which is unknown. Another survey of AA can be conducted several  
380 years later and compare it with this study to get conclusions. Thirdly, the population of this study  
381 were students of Chongqing Medical University and due to the special nature of their specialties,  
382 they will have a more scientific perception of physiological appearance than other college  
383 students. If the findings of this study are to be extended to other specialties or schools, the  
384 representative sample needs to be further expanded to reduce the error. In addition,  
385 unfortunately, we did not further exclude people with previous or current major psychological  
386 problems in our study, which may bias our findings.

387

## 388 **Conclusions**

389 The study confirmed that the four hypotheses mentioned in the introduction hold true.  
390 Specifically, lower IS and higher SS can effectively reduce depression caused by AA among  
391 Chongqing medical students. It also reconfirmed that AA can directly or indirectly influence the  
392 occurrence of depression in medical college students. In this study, it is also found that the  
393 presence of IS and SS works as mediator regulating the mechanism of action between AA and  
394 depression. It helps to clarify the potential mechanisms between AA and depression. The aim is  
395 to improve the physical and mental health of medical college students and appeal to the society  
396 to give high priority to young people. Schools and other relevant departments can learn from the  
397 existing studies and actively carry out activities such as group counseling and group sand tray  
398 games to help individuals reduce IS and the occurrence of depression among college students  
399 studying in medical schools. At the same time, medical college students should also actively  
400 communicate with people around them, improve their interpersonal skills and avoid over-  
401 interpreting the feelings and behaviors of others to reduce their own psychological burden.

402

403

## 404 **Acknowledgements**

405 We thank each and every participant for their support of our study.

406

## 407 **Ethics approval and consent to participate**

408 The study involving human participants was reviewed and approved by the Ethics Committee of  
409 Chongqing Medical University. Participants provided written informed consent to participate in  
410 this study.

## 411 **Consent for publication**

412 Informed consent was obtained from all subjects involved in the study.

## 413 **Availability of data and materials**

414 The datasets used and analyzed during the current study are available from the corresponding  
415 author on reasonable request.

## 416 **Conflicts of Interest**

417 The authors declare no conflict of interest.

**418 Funding**

419 This research was funded by the Humanities and Social Sciences Research Project Fund of  
420 Chongqing Municipal Education Commission in 2022, grant number NO.22SKGH052.

**421 Authors' contributions**

422 Each author has met the authorship requirements. X.X., Y.Z., X.Z., X.W. and X.D. wrote the  
423 main manuscript text. Y.Z. organized the data and X.X. completed all data analysis. X.X. and  
424 L.Q. prepared the figures and tables. X.X., Y.Z. and M.Y. supervised the writing of the  
425 manuscript. X.X., Y.Z., X.Z., X.W., X.D., L.Q., B.M. and Y.H. investigated the data. All authors  
426 have read and agreed to the published version of the manuscript.
