

Reviewer 1

This is an interesting study, in which the authors focused attention on the effectiveness and tolerance of different dietary therapy strategies for the Crohn's disease (CD) in pediatric patients. Ma et al. found that the partial enteral nutrition plus Crohn's disease exclusion diet (PEN+CDED) exhibited significant superiority over PEN alone and higher tolerance than EEN. They further revealed that the PEN+CDED intervention (90.5%) achieved the highest ranking in clinical remission rate. This systematic review provides evidence that PEN+CDED can be used as an alternative treatment to Exclusive enteral nutrition and is more suitable for long-term management in children. However, there are some details that need to be improved. Following is, the content to be supplemented in the revised paper.

Line109-110. What does “of to Fig out” mean?

The quality of the Figure 1 is blurred. Please renew the Figure.

Line 126-127. It was unclear what the authors wanted to express. Could you correct it, please?

In the introduction and discussion parts, what is the connection between the primary results and secondary outcome? It will be a little better if you add the connection between the primary results and secondary outcome in the article.
