### **Public Review**

#### **Confidential note to the editor**

no additional comments from me in this case.

#### **Basic reporting**

The manuscript with the title: Extraction, identification and component analysis of exosome-like nanovesicles in *Anoectochilus roxburghii* (Wall.) Lindl. basically is a report from analytical studies of chemical compositions of the plant. The result is actually interesting, especially to my concern is that the quantity of chemicals investigated in the plant grown in soil is much higher than its quantity in plant grown in hydroponic. Unfortunately there is not enough discussion regarding the result such as why this difference in chemical quantity is happened.

#### **Experimental design**

In the section of materials and methods, the manuscript did not mention references used at all, as if the methods conducted in the experiment never been used by other works, or the method is something universal where there is no reference is needed there.

#### **Validity of the findings**

The finding is interesting, whoever it needs more discussion, i.e. comparison with other works.

#### **Additional comments**

The manuscript needs more elaborate discussion in comparing the result with other works and explanation why the result showed as mentioned.
