66 **Abstract**

67 **Background:** The problem of access to medical information, particularly in low-income
68 countries, has been under discussion for many years. Although a number of developments have
69 occurred in the last decade (e.g. the open access movement and the website Sci-Hub), everyone
70 agrees that these difficulties still persist very widely, mainly due to the fact that paywalls still
71 limit access to approximately 75% of scholarly documents. In this study, we compare the
72 accessibility of recent full text articles in the field of ophthalmology in 27 established institutions
73 located worldwide. **Methods:** Two-hundred references from articles were retrieved using the
74 PubMed database. Each article was individually checked for Open Access (OA). Full texts of
75 non-OA (i.e. “paywalled articles”) were examined to determine whether they were available
76 using institutional and Hinari access in each institution studied, using “alternative ways” (i.e.
77 PubMed Central, ResearchGate, Google Scholar, and Online Reprint Request), and using the
78 website Sci-Hub. **Results:** The number of full texts of “paywalled articles” available using
79 institutional and Hinari access showed strong heterogeneity, scattered between 0% full texts to
80 94.8% (mean= 46.8%; SD=31.5; median=51.3%). We found that complementary use of
81 “alternative ways” and Sci-Hub leads to 95.5% of full text “paywalled articles”, and also divides
82 by 14 the average extra costs needed to obtain all full texts on publishers’ websites using pay-
83 per-view. **Conclusions:** The scant number of available full text “paywalled articles” in most
84 institutions studied encourages researchers in the field of ophthalmology to use Sci-Hub to
85 search for scientific information. The scientific community and decision-makers must unite and
86 strengthen their efforts to find solutions to improve access to scientific literature worldwide and
87 avoid an implosion of the scientific publishing model.

88 This study is not an endorsement for using Sci-Hub. The authors, their institutions, and
89 publishers accept no responsibility on behalf of readers.

90 **Introduction**

91 High-quality information is essential for effective health systems as well as scientific progress
92 and development (UNESCO, 1997; Koehlmoos & Smith, 2011). Access to information in order
93 to facilitate adequate health care is also considered to be a human right (Goehl, 2007; “Universal

94 Declaration of Human Rights,” 2015). On the contrary, the lack of access to knowledge is the
95 main limitation to human development (The Lancet, 2011) and the principal barrier to
96 knowledge-based health care in developing countries (Godlee et al., 2005).

97 Research studies are based on bibliographic research work to achieve "the state of the art". This
98 stage not only makes it possible to carry out research studies based on existing and well
99 established scientific foundations, but also prevents carrying out studies already conducted by
100 other researchers in the world. Thus, access to scientific articles for researchers around the world
101 is crucial for assessing high-quality research. In the current revenue-models of scientific journals,
102 access to scientific papers is often restricted by paywalls. This implies that full text articles are
103 only available upon subscription or pay-per-view on publisher websites. One is forced to note
104 that paywalls still limit access to approximately 75% of scholarly documents in all disciplines
105 (Bosman & Kramer, 2018; Piwowar et al., 2018), including biology and medicine (Boudry &
106 Durand-Barthez, 2017; Bosman & Kramer, 2018). Moreover, “paywalled articles” are known to
107 disadvantage the lowest-income countries in terms of access to articles (Aronson, 2004;
108 Himmelstein et al., 2018).

109 Several initiatives have been implemented worldwide to facilitate access to scientific literature.
110 For researchers in developing countries, a specific program called Hinari (Health InterNetwork
111 Access to Research Initiative) was launched in 2002 for medicine. Hinari was developed by the
112 World Health Organization (<http://www.who.int/hinari/en/>) and is now part of one of the five
113 Research4Life programs created to reduce the knowledge gap in developing countries. It
114 provides free or very low-cost online access to resources in the biomedical literature for not-for-
115 profit institutions in developing countries, based on socio-economic factors (“WHO | Hinari
116 Access to Research for Health programme”). In 2011, in response to a lack of access to scientific
117 articles in Kazakhstan (Bohannon, 2016), Alexandra Elbakyan launched website Sci-Hub,
118 allowing direct downloading of articles, bypassing publisher paywalls. A recent study showed
119 that Sci-Hub contains 85.1% of all articles published in subscription-based journals
120 (Himmelstein et al., 2018), and is extensively used worldwide in low-, middle- but also in high-
121 income countries to circumvent paywalls (Bohannon, 2016). Such means of obtaining full text
122 articles raises many legal (Kemsley; Greco, 2017) and ethical questions (Bendezú-Quispe et al.,
123 2016; Saleem, Hasaali & Ul Haq, 2017; Hoy, 2017).

124 Data on the availability of scientific literature are often obtained from single-nation studies
125 (Nisonger, 2011; Malapela & de Jager, 2017), and to the best of our knowledge, worldwide
126 comparisons have not been carried out. Consequently, it is still not well known how paywalls
127 may affect researchers worldwide. The primary objective of this study was to evaluate the
128 accessibility of recent full text articles in the field of ophthalmology in established institutions
129 distributed worldwide using “institutional and Hinari access”, then “alternative ways” (PubMed
130 Central, ResearchGate, Google Scholar and Online Reprint Request), and finally Sci-Hub. The
131 secondary objective was to calculate extra costs institutions or researchers must bear to recover
132 all full texts, buying them on publishers’ websites.

133 **Materials & Methods**

134 The search for articles to be included in this study was carried out on March 29th, 2018 using the
135 PubMed database (<http://www.ncbi.nlm.nih.gov/pubmed>), developed by the National Center for
136 Biotechnology Information (NCBI) at the National Library of Medicine (NLM). The search
137 strategy was: eye diseases [MH] AND 2017:2018 [DP] AND english [LA] AND Journal Article
138 [PT] where MH stands for “Medical Subject Headings,” DP “Date of Publication,” and PT
139 “Publication Type”. “Journal Article” includes the following publication types: journal articles,
140 introductory journal articles, and reviews as previously described in the field of ophthalmology
141 (Boudry et al., 2016). Data were downloaded from PubMed in Comma-Separate values (CSV)
142 and were imported to Microsoft Excel 2013 (Microsoft, Redmond, USA) for data processing.
143 This publication search resulted in a total of 11,103 articles recently published in the field of
144 ophthalmology from which two hundred (Tenopir et al., 2010) were randomly selected.
145 Confidence intervals were calculated taking into consideration the sample size studied (200),
146 with a margin of error of 5%.

147 **Access to full text articles**

148 Each of these two hundred articles was individually checked for Open Access (OA) on the
149 publisher’s websites on April 3rd and 4th, 2018. Articles were labelled as “publisher OA” if the
150 full text was accessible freely on the publisher’s website without requiring subscription. Articles
151 were labelled as “paywalled” if the full text was only available with a subscription.

152 The recruitment of the participants in the different institutions included in this study was done by
153 searching recent articles (published in 2017 or 2018) in the field of ophthalmology. The
154 researchers were contacted by email using corresponding authors' email addresses, or by
155 contacting researchers already known by CB and FM directly. Only researchers working in
156 capital cities or belonging to the most populated cities in their countries were chosen. Emails
157 were sent to correspondents/colleagues to ask them to participate in this study, with the goal of
158 reaching at least 25 countries located worldwide and spread over all continents.

159 Countries of researchers who agreed to collaborate were classified by continents according to the
160 United Nations classification ("United Nations Statistics Division- Standard Country and Area
161 Codes Classifications (M49)") and classified by income level according to the World Bank
162 classification ("Data | The World Bank"). Each participant had to search for "paywalled articles"
163 in order to recover their full texts, using their institutional access and Hinari resources if
164 available in their institutions, following a normalized protocol (*see Supplemental Information 1*
165 *and Supplemental Information 2*). The Hinari offer is available to two groups of countries: group
166 A (free access for 69 countries) and group B (1500 US dollars per calendar year for 50 countries)
167 ("WHO | Hinari Access to Research for Health programme").

168 Additionally, individual searches for all full text "paywalled articles" were done using
169 "alternative ways" for evaluating the ability to find full texts of unavailable "paywalled articles"
170 through institutional and Hinari access. These searches were done using the Digital Objects
171 Identifiers (DOI) or titles of each article in the following order:

172 - Via PubMed Central open repository (<https://www.ncbi.nlm.nih.gov/pmc/>), the main free full-
173 text open archive of biomedical and life sciences journal literature. Full text articles on PubMed
174 Central are legally deposited either by publishers or by authors themselves;

175 - Via the academic social network ResearchGate (<http://www.researchgate.net/>). Full text articles
176 on ResearchGate (RG) are deposited by authors, sometimes without respecting publishing
177 agreements and copyright laws (Jamali, 2017);

178 - Via Google Scholar (<https://scholar.google.com/>), looking at the first ten results listed
179 (Nicholas et al., 2017). Full texts retrieved via Google Scholar are those found by the search

180 engine on websites throughout the internet, without any guarantee of legality regarding copyright
181 laws;

182 - Via online reprint request (ORR). ORR use the corresponding author email to obtain non-open-
183 access literature using reprints furnished by publishers to the corresponding author after
184 publication of an article. ORR is thus fully legal.

185 Full texts retrieved via PubMed Central, RG, Google Scholar or ORR were labelled as
186 “alternative ways”.

187 - Via the Sci-Hub website. This means of obtaining full text is illegal in many countries in the
188 world as full texts on Sci-Hub are pirated from legal websites such as libraries, without regard to
189 copyright laws.

190 As the accessibility of full text “paywalled articles” using Sci-hub was independent of the
191 geographical location where the search was done, searches for full text “paywalled articles”
192 using Sci-hub were performed from France, from a non-university Internet access. No university
193 or institution of the authors of this study was therefore involved in downloading articles via Sci-
194 Hub.

195 This study has been approved by the Ethics Committee of the University Hospital of Rennes.”

196 **Financial implications of unavailable full text articles**

197 When researchers do not have access to full text “paywalled articles” through the different means
198 of access at their disposal, they can buy them individually on publisher’s websites (pay-per-
199 view). However, this extra cost presents the disadvantage of being borne directly by the
200 institution or laboratory, and sometimes by the researchers themselves. Extra costs of unavailable
201 full text “paywalled articles” were calculated both in US dollars and as the percentage of gross
202 domestic product (GDP) per capita at purchasing power parity (PPP). For each “paywalled
203 article”, the cost of the pay-per-view of each article was recovered from the publisher's website
204 in US dollars. When the price was in euros, it was converted to US dollars using the exchange
205 rate in use on April 5th, 2018. The cost of unavailable full text articles in each institution was
206 calculated in US dollars, and was also expressed as the percentage of the GDP per capita at
207 purchasing power parity (PPP) (current international \$), using the World Development Indicators

208 from the online databases of the World Bank (“Data | The World Bank”). The GDP is the market
209 value of all officially recognized final goods and services produced within a country in a given
210 period. Using the percentage of GDP per capita at PPP allows us to assess the real financial
211 burden of providing full text articles in relation to the standard of living of each country.

212 **Results**

213 We received 26 positive responses to the 166 emails sent seeking colleagues for participation in
214 this study. *Table 1* describes institutions and characteristics of the 27 countries included in the
215 present study. Four were Hinari group A (Cameroon, Democratic Republic of Congo, Senegal,
216 and Togo), whereas four were Hinari group B (Egypt, Tunisia, Jordan, and Pakistan) and 19
217 others were not Hinari eligible. Among institutions located in Hinari group B eligible countries,
218 only the University El-Manar (Tunisia) applied to obtain Hinari resources.

219 **Access to full text articles**

220 Among the 200 articles studied, 85 full texts (42.5%) were freely available on publishers’
221 websites (“publisher OA” articles), whereas 115 (57.5%) full texts were available only with
222 subscriptions (“paywalled articles”). See *Supplemental Information 3* for the list of the 115
223 “paywalled articles”.

224 Figure 1 presents the number of full texts of the 115 “paywalled articles” available in each
225 institution using institutional and Hinari access. It must be emphasized that the number of
226 available full texts using institutional and Hinari access showed substantial heterogeneity,
227 scattered between 0 (0%) full texts and 109 (94.8%). An average of 53.8 (46.8%) full text
228 “paywalled articles” (SD=31.5) were available (*Table 2*). Half of the institutions had access to
229 less than 59 (51.3%) full text “paywalled articles” (IQR=49).

230 Regarding “alternative ways”, 82 e-mails of corresponding authors were found via PubMed or
231 via the Publisher website, and online reprint requests were sent to them. Thirty-one responses
232 were received (43.9% success rate), allowing us to obtain 26.96% of “paywalled articles” using
233 online reprint requests. No full texts of paywalled articles were found on the open archive PMC
234 (paywalled articles included in this study were very recent and still under publisher embargoes,

235 prohibiting self-archiving in OA repositories), and only 13 (11.30%) were found on social
236 academic networks and internet via Google Scholar.

237 To complete the search for unavailable full texts using institutional and Hinari access,
238 researchers could use “alternative ways” (PubMed Central, RG, Google Scholar and ORR).

239 As presented in *Table 2*, by using complementary “alternative ways”, an average of 73.3 of the
240 115 (63.7%) full text “paywalled articles” were available (SD=22.2). The range of the number of
241 available full texts varied among the institutions studied from 37 (32.2% for the Pakistan
242 Institute of Community Ophthalmology and the State University of Milagro) to 111 (96.5% for
243 Leiden University Medical Center) of the 115 “paywalled articles”.

244 Used alone, Sci-hub allows the recovery of 108 full texts (93.9%) of 115. Despite its illegal
245 nature, researchers may be tempted to use this website, to try to find the unavailable full texts
246 using institutional/Hinari access and “alternative ways”. Interestingly, using Sci-Hub as a
247 complement to institutional/Hinari access and “alternative ways” allowed the recovery of an
248 average of 109.8 (95.5%) full texts (SD=1.8). Thus, the range of the number of available full
249 texts varied very slightly from 108 (93.9%) to 113 (98.3%) of the 115 “paywalled articles”.

250 Moreover, for Pakistan Institute of Community Ophthalmology and State University of Milagro,
251 complementary use of Sci-Hub allowed them to recover 108 full texts of 115 instead of 37. As
252 shown in Figure 2, when considering access by continent (a) or by income level (b), using
253 complementary “alternative ways” tightens the gaps between continents and between countries
254 of low and high income level. Using Sci-Hub as a complement to institutional/Hinari access and
255 “alternative ways” totally eliminates the inequalities of access to “paywalled articles” by
256 continent or income level.

257 **Financial implications of unavailable full text articles**

258 Extra costs of unavailable full text “paywalled articles were assessed after using
259 institutional/Hinari access, after using institutional/Hinari access and “alternative ways”, and
260 after using institutional/Hinari access, “alternative uses”, and Sci-Hub (*Table 3*).

261 Using institutional/Hinari access, the average extra cost (in US dollars) of unavailable full text
262 “paywalled articles” would be \$2,790.8. However, this extra cost varies greatly from one

263 institution to another: from \$258 (Leiden University Medical Center) to \$5,240.9 (State
264 University of Milagro and Pakistan Institute of Community Ophthalmology). Using alternative
265 ways in addition to institutional/Hinari access, extra costs would be reduced by an average of
266 \$1,918.6. Interestingly, complementary use of Sci-Hub reduces the average extra cost of
267 unavailable full texts even more, dividing this average extra cost of unavailable full texts by 14
268 (\$198.4 instead of \$2790.8 using institutional/Hinari access and “alternative ways”). Likewise,
269 the average extra cost expressed as the percentage of GDP per capita at PPP is reduced more
270 than ten-fold (2.4% instead of 25.4%) for the 27 institutions studied. This extra cost is thus
271 substantial in some institutions, e.g. in Togo, where it is at 18.8%.

272 **Discussion**

273 In order to describe the difficulty in accessing scientific literature, a number of studies only
274 focusing on one country have been conducted, mostly in the USA, to assess the availability of
275 journals or books in university libraries (Nisonger, 2011). Other studies have been conducted to
276 analyze global access and use of digital resources in research, mainly in African universities
277 (Harle, 2009; Malapela & de Jager, 2017; Bruijns et al., 2017). To the best of our knowledge,
278 only one study in 2011 previously evaluated the accessing of recent full text “paywalled
279 articles”, and included seven institutions located in Africa, North and South America, Asia, and
280 Europe (Voronin, Myrzahmetov & Bernstein, 2011). Furthermore, the problem of accessing
281 medical information in low-income countries is still being openly discussed (Aronson, 2004;
282 Godlee et al., 2005; Goehl, 2007; Himmelstein et al., 2018). We believe that our study provides
283 the most complete comparative study examining worldwide access to recent full text articles. In
284 addition, it is the first to study the financial implications of limited access to scientific literature
285 and the first to assess Sci-Hub’s performance as an alternative to legal institutional access. The
286 field of ophthalmology was chosen because, for several years, our research team has been
287 focusing its research on bibliometrics in the field of ophthalmology.

288 Our study nevertheless has a number of limitations. The number of countries studied is relatively
289 low, particularly Hinari eligible countries, which can be explained by the difficulty in finding
290 researchers in the field of ophthalmology in most of the Hinari group A and B eligible countries.
291 Indeed, when we looked for collaborators to participate in this study, we found very few
292 researchers in the field of ophthalmology located in these countries (personal data). Moreover,

293 institutions studied in each country are inevitably not representative of the overall situation in the
294 country, and requesting participation from all the institutions in a country is impossible.
295 Nevertheless, to minimize the differences between institutions, only those located in capital cities
296 or belonging to the most populated cities in their countries were chosen. Finally, it was not
297 possible to obtain an average value of access to full text “paywalled articles” by country and to
298 calculate correlations between the number of accessible full texts and socio-economic parameters
299 (e.g. GDP per capita). For the same reasons, it was impossible to assess whether the use of
300 Hinari resources significantly changed the number of available full text “paywalled articles”.
301 Furthermore, we wanted to compare the results obtained with the three ways of accessing full
302 text “paywalled articles”. Our data included the average number of full texts available and the
303 average extra costs, in US dollars and expressed as the percentage of GDP per capita at PPP. We
304 found that using institutional/Hinari access; using institutional/Hinari access and “alternative
305 ways”; and using institutional/Hinari access, “alternative ways”, and Sci-Hub were significantly
306 different at $p < .05$ (p -value $< .001$). However, as the ways of accessing full text “paywalled
307 articles” were not independent (because of the cumulative effect that binds them), these
308 statistical results were not taken into account. We deliberately limited the search to articles
309 published in 2017-2018 to include only very recent articles. This allowed us to access the latest
310 findings which are thus presumed to be more informative for clinicians and researchers than
311 older ones. Nevertheless, due to embargo periods, we must note that including articles published
312 over a wider time period could have led to more frequent inclusion of articles freely available on
313 publishers’ websites (“publisher OA” articles) and articles using “alternative ways”.

314 Our study nonetheless provides a global vision of the difficulty involved in accessing scientific
315 literature around the world, highlighting the shortcomings of institutional access, which can have
316 significant financial consequences for researchers seeking to overcome them. Our study also
317 shows that the use of the website Sci-Hub helps to overcome these shortcomings and financial
318 consequences.

319 The open access (OA) movement has been progressively making more articles openly available.
320 However, articles behind paywalls (“paywalled articles”) are still more numerous than “publisher
321 OA” articles in our study (57.5% and 42.5%, respectively). These results are in agreement with
322 the most recent studies, which estimate that, in biology and medicine, 39.1% to 50% of articles

323 published are “publisher OA” articles (Boudry & Durand-Barthez, 2017; Bosman & Kramer,
324 2018). We found that researchers in ophthalmology working in the 27 institutions included in
325 this study can access only an average of 46.8% (with very large disparities, varying from 0% to
326 94.8%) of full text “paywalled articles” using their institutional and Hinari access. Furthermore,
327 half of the 27 institutions studied can offer access to just over 50% of full text “paywalled
328 articles”, a value very close (56%) to that determined in 2011 for seven institutions located in
329 Africa, North and South America, Asia, and Europe (Voronin, Myrzahmetov & Bernstein, 2011)
330 showing that the situation has not improved in recent years. As previously pointed out by
331 Machin-Mastromatteo (Machin-Mastromatteo, Uribe-Tirado & Romero-Ortiz, 2016), this shows
332 that, “many universities are unable to acquire subscriptions for years, because they are seriously
333 hindered by budget limitations and the lack of interest and policies from the state for supporting
334 research and access to scientific resources”. Researchers in ophthalmology working in the less
335 privileged institutions are thus in very poor situations. Indeed, although they use “alternative
336 ways” (i.e. PubMed Central, RG, Google Scholar and ORR) to recover full texts, they are forced
337 to use Sci-Hub if they want to access a sufficient number of full text articles necessary to
338 conduct their research satisfactorily. Researchers cannot afford these articles because their yearly
339 budget for accessing articles without using Sci-Hub is too high, with sums of money up to
340 \$3,597 (institutions in Pakistan or Ecuador), or more than 200% of the GDP per capita at PPP
341 (202.3% in Ecuador).

342 Results of the present study showed that “alternative ways” might help researchers access full
343 text “paywalled articles”. We would like to draw particular attention to the usefulness of online
344 reprint requests (ORR). Although ORR does not immediately provide access and is a laborious
345 procedure which depends on many factors that vary between individuals, ORR are quite efficient
346 for obtaining full text “paywalled articles” (Kanthraj, 2010). Applied to our set of “paywalled
347 articles” they allow free access to the full texts of 31 (26.96%) of 115, which is not negligible.
348 An effort should be made to make them more widely known, particularly in less privileged
349 countries, where they are the least used (Burrows, 1996). Another way to promote the use of
350 ORR would be to have publishers and Pubmed make an extra effort to communicate, free of
351 charge, corresponding authors’ email addresses (only 37 emails were found on the PubMed
352 website, and 81 were accessible free of charge on publisher websites). Indeed, some publishers
353 disclose corresponding authors’ email addresses only on the full text of articles attainable only

354 through subscription, making it impossible to use ORR. Widely used globally (Bohannon, 2016),
355 Sci-Hub raises many questions about the future of scientific publication (Russell & Sanchez,
356 2016; McNutt, 2016; Machin-Mastromatteo, Uribe-Tirado & Romero-Ortiz, 2016; Strielkowski,
357 2017). Our results showed that using Sci-Hub makes it possible to drastically reduce the
358 inequalities of access to “paywalled articles” in the institutions studied, in terms of number of
359 accessible full texts and the money spent to buy them on publishers’ websites. As already
360 pointed out by Bendezú-Quispe *et al.* and Machin-Mastromatteo *et al.* (Bendezú-Quispe *et al.*,
361 2016; Machin-Mastromatteo, Uribe-Tirado & Romero-Ortiz, 2016), our data show that Sci-Hub
362 can help clinicians in ophthalmology working in less privileged institutions or countries
363 worldwide by allowing them to obtain essential information and respond appropriately to patient
364 care needs. Without this option, they would not be able to cope with the demands of their
365 profession. Nonetheless, as shown by (Bohannon, 2016; Machin-Mastromatteo, Uribe-Tirado &
366 Romero-Ortiz, 2016), Sci-Hub is not only used in less privileged countries, and a correlation has
367 been shown between the number of downloads per 1,000 inhabitants on Sci-Hub and the Gross
368 Domestic Product (GDP) per inhabitant (Greshake, 2016). As examples, the United States is the
369 fifth largest downloader after Russia, and a quarter of the Sci-Hub requests came from the 34
370 members of the Organization for Economic Co-operation and Development, the wealthiest
371 nations with, as shown in this study, the best journal access. The use of Sci-Hub by these
372 countries can be defined as a use “by convenience” rather than necessity (Bohannon, 2016; Hoy,
373 2017; Lawson, 2017), and could easily decrease by improving library interfaces (Faust, 2016). In
374 the long term, Sci-Hub might disrupt the whole system of academic publishing because it harms
375 publishers due to the lost profits generated by its use (Strielkowski, 2017). In order to limit such
376 losses, publishers could be tempted to increase their subscription rates (Russell & Sanchez,
377 2016), which have been steadily increasing in recent years (Hoy, 2017; Himmelstein *et al.*,
378 2018), which may lead to cancellations or reduction of subscriptions by institutions worldwide
379 (Schiermeier & Mega, 2017). This would have the effect of further accentuating inequalities.
380 Publishers could also be tempted to further generalize “gold OA” (authors pay article processing
381 charges (APC) to publish their articles) as the default publication model (Novo & Onishi, 2017;
382 Strielkowski, 2017). This model is not beyond criticism because it favors the existence of
383 predatory publishers (Beall, 2012). It also generates inequalities between authors who have funds
384 to pay APC (whose cost is often prohibitive) and those who do not (Danda, 2014), despite many

385 publishers providing discounts at the request of the authors or according to their geographical
386 location. Some publishers have reacted by bringing lawsuits against Sci-Hub to shut down the
387 site (Kemsley; Greco, 2017). So far, these attempts have been unsuccessful, and it is likely that
388 future attempts will lead to the same outcome (Hoy, 2017). It now seems that Sci Hub will cease
389 to operate only if and when the conditions that make it essential disappear (Lawson, 2017), i.e.
390 that access to the articles through legal channels will not be as unequal as we have shown in this
391 study. To achieve this, in addition to the suggestion mentioned above, several paths can be taken:
392 including more countries in the Hinari program (particularly upper-middle income countries)
393 (Bendezú-Quispe et al., 2016); promoting Green OA (self-archiving in OA repositories) by
394 setting up institutional or national OA policies (Kirsop & Chan, 2005; Machin-Mastromatteo,
395 Uribe-Tirado & Romero-Ortiz, 2016), (e.g. as it has been done recently in France) (Boudry &
396 Durand-Barthez, 2017); and implementing subscription-based access for a reasonable price. This
397 has already been done in other areas, particularly in the field of music, “offering individual
398 subscription-based access to all articles from all imaginable databases for a price that most
399 scientists in any corner of the world could afford” (Strielkowski, 2017).

400 **Conclusions**

401 Regardless of the solutions chosen, it is urgent that the scientific community as well as decision-
402 makers, mobilize effectively to limit these inequalities of access to scientific “paywalled articles”
403 in order to solve this problem which has persisted for far too long, and finally free researchers
404 from this daily dilemma: Sci-Hub or not Sci-Hub?

405 **Warning:** “Sci-Hub does not restrict itself to only openly licensed content. Instead, it retrieves
406 and distributes scholarly literature without regard to copyright regimes. Readers should note that,
407 in many jurisdictions, use of Sci-Hub may constitute copyright infringement. Users of Sci-Hub
408 do so at their own risk. This study is not an endorsement of using Sci-Hub, and its authors and
409 publishers accept no responsibility on behalf of readers. There is a possibility that Sci-Hub users
410 — especially those not using privacy-enhancing services such as Tor — could have their usage
411 history unmasked and face consequences, both legal or reputational in nature.” (Himmelstein et
412 al., 2018).

413 Acknowledgements

414 The authors would like to thank Pr. Martine Jager (Leiden University Medical Center) for her
415 help in finding a collaborator in the Netherlands and Chloé Rousseau and Dr. Florian Naudet for
416 their help for reviewing the statistical analysis.

Figure 1

Number of full text “paywalled articles” available (n=115) for each of the 27 institutions included in the study

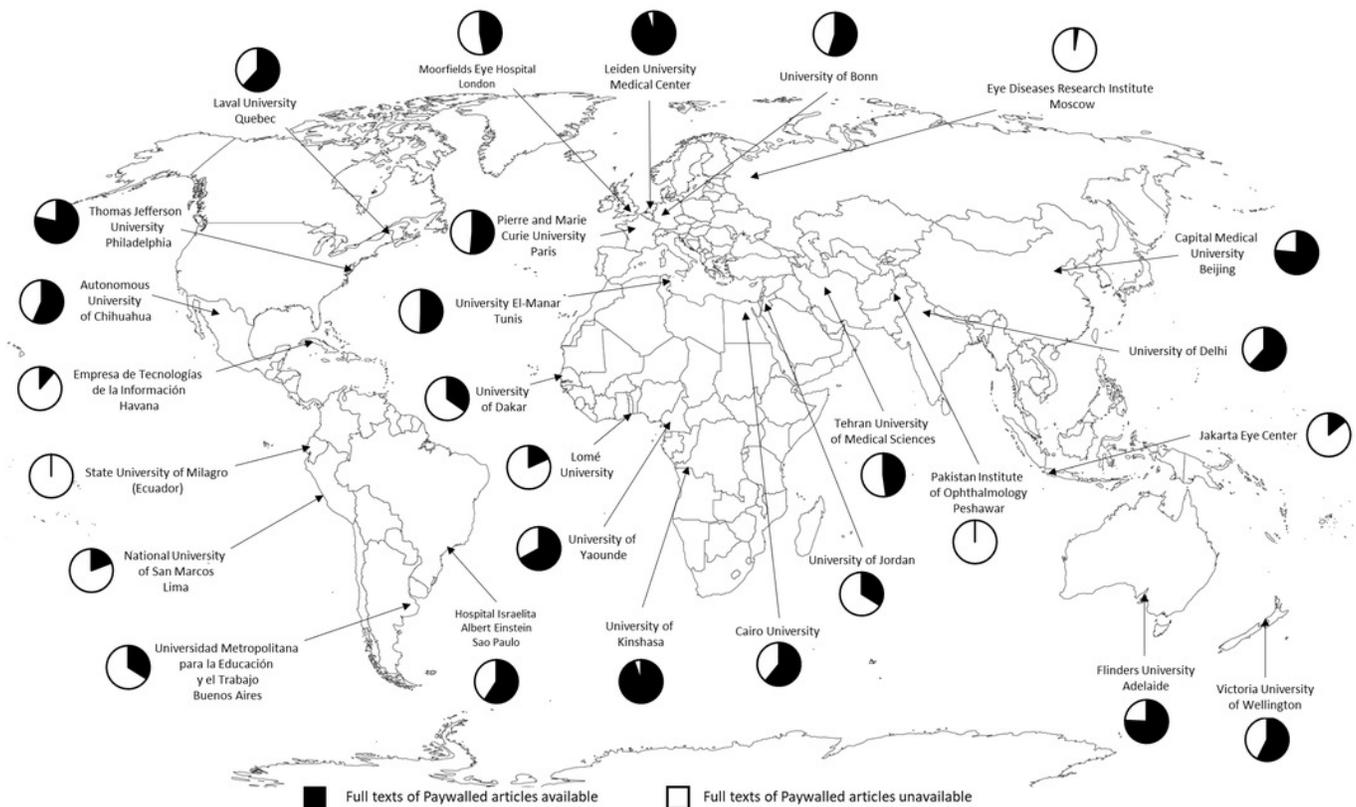

Figure 2

Number of full text “paywalled articles” available by continent (a) and by income level (b) using institutional and Hinari access, “alternative ways” (PubMed Central, RG, Google Scholar, and ORR), and Sci-Hub. * If available.

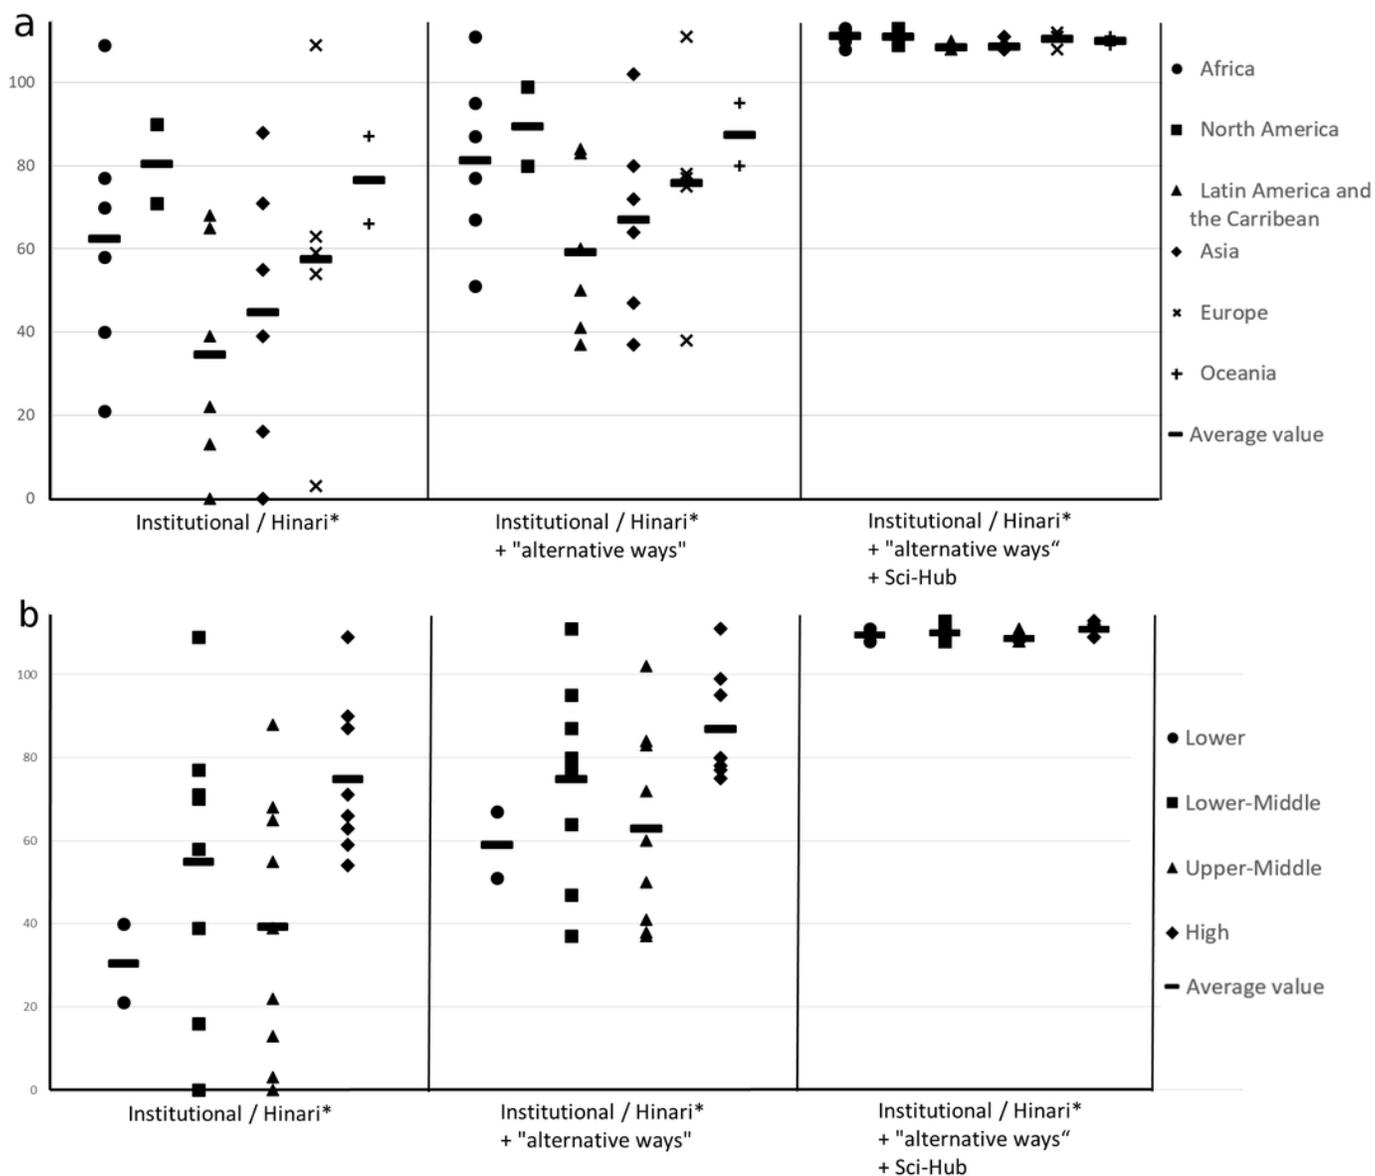

Table 1 (on next page)

Institutions included in the study presented by continents (listed alphabetically).

Institution	Country / continent	World bank classification by income level
University of Yaounde	Cameroon	Lower-middle
University of Kinshasa	Democratic Republic of the Congo	Lower-middle
Cairo University	Egypt	Lower-middle
University of Dakar	Senegal	Low
Lomé University	Togo	Low
University El-Manar, Tunis	Tunisia	Lower-middle
Laval University	Canada	High
Thomas Jefferson University, Philadelphia	United States of America	High
Universidad Metropolitana para la Educación y el Trabajo, Buenos Aires	Argentina	Upper-middle
Hospital Israelita Albert Einstein, Sao Paulo	Brazil	Upper-middle
Empresa de Tecnologías de la Información, Havana	Cuba	Upper-middle
State University of Milagro	Ecuador	Upper-middle
Autonomous University of Chihuahua	Mexico	Upper-middle
National University of San Marcos, Lima	Peru	Upper-middle
Capital Medical University, Beijing	China	Upper-middle
University of Delhi	India	Lower-middle
Jakarta Eye Center	Indonesia	Lower-middle
Tehran University of Medical Sciences	Islamic Republic of Iran	Upper-middle
University of Jordan	Jordan	Lower-middle
Pakistan Institute of Community Ophthalmology, Peshawar	Pakistan	Lower-middle
Pierre and Marie Curie University, Paris	France	High
University of Bonn	Germany	High
Leiden University Medical Center	The Netherlands	High
Eye Diseases Research Institute, Moscow	Russian Federation	Upper-middle
Moorfields Eye Hospital, London	United Kingdom	High
Flinders University, Adelaide	Australia	High
Victoria University of Wellington	New Zealand	High

Table 2 (on next page)

Number of full text “paywalled articles” available using institutional and Hinari access, “alternative ways” (PubMed Central, RG, Google Scholar, and ORR), and Sci-Hub.

* : if available. ** : confidence intervals were calculated considering the sample size studied (200), with a margin of error of 5%. Institutions are sorted by continent, countries are listed alphabetically.

Institution	Institutional / Hinari* n (%)	Institutional / Hinari* +"alternative ways" n (%)	Institutional / Hinari* +"alternative ways"+ Sci- Hub n (%)
University of Yaounde (Cameroon)	77 (67)	95 (82.6)	113 (98.3)
University of Kinshasa (Democratic Republic of the Congo)	109 (94.8)	111 (96.5)	113 (98.3)
Cairo University (Egypt)	70 (60.9)	87 (75.7)	110 (95.7)
University of Dakar (Senegal)	40 (34.8)	67 (58.3)	111 (96.5)
Lomé University (Togo)	21 (18.3)	51 (44.3)	108 (93.9)
University El-Manar, Tunis (Tunisia)	58 (50.4)	77 (67)	112 (97.4)
Laval University, Quebec (Canada)	71 (61.7)	80 (69.6)	109 (94.8)
Thomas Jefferson University, Philadelphia (United States of America)	90 (78.3)	99 (86.1)	113 (98.3)
Universidad Metropolitana para la Educación y el Trabajo. Buenos Aires (Argentina)	39 (33.9)	60 (52.2)	108 (93.9)
Hospital Israelita Albert Einstein, Sao Paulo (Brazil)	68 (59.1)	84 (73)	109 (94.8)
Empresa de Tecnologías de la Información, Havana (Cuba)	13 (11.3)	41 (35.7)	108 (93.9)
State University of Milagro (Ecuador)	0 (0)	37 (32.2)	108 (93.9)
Autonomous University of Chihuahua (Mexico)	65 (56.5)	83 (72.2)	110 (95.7)
National University of San Marcos, Lima (Peru)	22 (19.1)	50 (43.5)	108 (93.9)

Table 3(on next page)

Extra cost of full text “paywalled articles” unavailable using institutional/Hinari access; using institutional/Hinari accesses and “alternative ways”; and using institutional/Hinari access and “alternative ways” and Sci-Hub.

* : if available. Extra cost indicates the sum of the price of unavailable full texts bought individually on publishers’ websites in US dollars, or between brackets expressed as percentage gross domestic product (GDP) per capita at purchasing power parity (PPP) (current international \$).

Institution	Institutional / Hinari*	Institutional / Hinari* +"alternative ways"	Institutional / Hinari* +"alternative ways"+ Sci-Hub
University of Yaounde (Cameroon)	1636.3 (45.3)	799.0 (22.1)	30 (0.8)
