A new genus of Xanthopygina rove beetles is described here as *Lendatus* **gen. nov.** The new genus includes three new species: *L. bolivianus* **sp. nov.**, described from Bolivia, *L. philothalpiformis* **sp. nov.** described from Costa Rica and Panama, and *L. platys* **sp. nov.** described from Bolivia, Colombia, Ecuador and Peru. *Lendatus* belongs to the *Isanopus* group of genera of Xanthopygina and can distinguished from all the genera based on the unique punctuation on the pronotum and the long apical setae of the paramere. A key to the three species of *Lendatus* along with photographs and illustrations is provided for the identification of species.

1 *Lendatus*, a new genus of Xanthopygina (Coleoptera: Staphylinidae:
2 Staphylininae) with description of three new species.

42 Abstract

43

44 A new genus of Xanthopygina rove beetles is described here as *Lendatus gen. nov.* The new
45 genus includes three new species: *L. boliviensis sp. nov.*, described from Bolivia, *L.
46 philothalpiformis sp. nov.* described from Costa Rica and Panama, and *L. platys sp. nov.
47* described from Bolivia, Ecuador and Peru. *Lendatus* belongs to the *Isanopus* group of genera of
48 Xanthopygina and can distinguished from all the genera based on the unique punctuation on the
49 pronotum and the long apical setae of the paramere. A key to the three species of *Lendatus* along
50 with photographs and illustrations is provided for the identification of species.

51

52

53

54 Introduction

55

56 Xanthopygina is a diverse group of mostly neotropical rove beetles that includes (before the
57 publication of this paper) 29 genera. In the latest phylogenetic analyses of the subtribe,
58 Chatzimanolis & Brunke (2019) were able to examine all genera of Xanthopygina and identified
59 the major lineages of the subtribe. One of them was the *Isanopus* group of genera, which
60 included four genera: *Zackfalinus* Chatzimanolis (Chatzimanolis 2012) as the sister group of
61 *Peripus* Chatzimanolis & Hightower (Chatzimanolis & Hightower 2019; identified in the
62 phylogeny paper as genus 5), and *Isanopus* Sharp (Chatzimanolis 2008) as the sister group of
63 genus 2. That genus 2 is described in this paper as the new genus *Lendatus* Chatzimanolis and
64 includes three new species.

65 The sister group relationship between *Isanopus* and *Lendatus* was first identified by
66 Chatzimanolis (2014) in the first molecular phylogeny of the subtribe, where *Lendatus* was
67 presented in that phylogeny as ‘undescribed genus’. Delimiting new taxa, especially above the
68 species level is not straightforward and ideally one should have multiple lines of evidence before
69 proposing formal taxonomic names. While I had strong molecular evidence that *Lendatus* is
70 indeed a new genus for quite some time, I did not feel comfortable describing *Lendatus* as new
71 taxon until the completion of the morphological analysis of the subtribe that included all
72 described genera and a number of undescribed ones.

73

74

75 Materials & Methods

76

77 Specimen preparation, study and photography followed other recently published papers on
78 Xanthopygina (e.g., Chatzimanolis & Hightower 2019). Dissected aedeagi were placed in small
79 glass vials filled with glycerin and pinned underneath the specimen. I took the following
80 measurements: HL: head length, at middle, from the anterior margin of frons to the nuchal ridge;
81 HW: Head width, the greatest width, including the eyes; PL: pronotum length, at middle; PW:
82 pronotum width, greatest width; EL: elytra length, measured in lateral view from the
83 anterolateral angle of the elytra to the apex of the elytra; however, I used these measurements
84 only proportionally (e.g., PW/PL). As a surrogate of total body length, I used forebody length
85 (FL), measured by adding HL+PL+EL. I examined specimens using an Olympus ZX10
86 stereomicroscope and I took photographs using a Canon 40D camera equipped with a MP-E 65

87 mm macro lens on a Cognisys StackShot 3X macro rail and controller (<https://www.cognisys-inc.com/products/stackshot/stackshot.php>). I automontaged images using Helicon Focus Pro
88 6.7.1 (<http://www.heliconsoft.com/heliconsoft-products/helicon-focus/>). I removed the
89 background of photographs using Fluid Mask 3 (<https://www.vertustech.com>). Type labels are
90 separated by a slash '/'. Text within brackets [] is explanatory and was not included in the
91 original label. Generic description was extracted from the matrix in Chatzimanolis & Brunke
92 (2019) with addition of a few other characters. I produced maps using the online program
93 SimpleMappr (Shorthouse 2010). In this paper, I used the phylogenetic species concept of
94 Wheeler & Platnick (2000) to delimit different species. Datasets for each species in DarwinCore
95 format are available online at https://figshare.com/authors/Stylianos_Chatzimanolis/384794.
96

97
98 I examined specimens from the following institutions:
99

100 BMNH	The Natural History Museum, London, UK (M. Barclay).
101 CMNC	Canadian Museum of Nature, Ottawa, ON, Canada (R. Anderson).
102 CMNM	Carnegie Museum of Natural History, Pittsburgh, PA, USA (R. Davidson).
103 CNC	Canadian National Collection, Ottawa, ON, Canada (A. Brunke).
104 CRO	G. de Rougemont collection, Oxford, UK (G. de Rougemont).
105 DEBU	University of Guelph Insect Collection, Guelph, ON, Canada (S. Marshall).
106 FMNH	Field Museum of Natural History, Chicago, IL, USA. (C. Maier).
108 MNCR-A	National Museum of Costa Rica, San José, Costa Rica (A. Ruiz).
109 MUSM	Universidad Nacional Mayor de San Marcos, Museo de Historia Natural, Lima, Peru (D. Silva).
111 NHMD	Natural History Museum of Denmark, University of Copenhagen, Copenhagen, Denmark (A. Solodovnikov).
113 SEMC	Snow Entomological Collection, Biodiversity Institute, University of Kansas, Lawrence, KS, USA (Z. Falin).
115 UNSM	University of Nebraska State Museum, Lincoln, NE, USA (B. Ratcliffe).
116 UTCI	The University of Tennessee at Chattanooga, Chattanooga, TN, USA (S. Chatzimanolis).

118
119 Please note that several of the specimens currently deposited in SEMC will be transferred to
120 MUSM per previous institutional/collecting agreements.
121

122 The electronic version of this article in Portable Document Format (PDF) will represent a
123 published work according to the International Commission on Zoological Nomenclature (ICZN),
124 and hence the new names contained in the electronic version are effectively published under that
125 Code from the electronic edition alone. This published work and the nomenclatural acts it
126 contains have been registered in ZooBank, the online registration system for the ICZN. The
127 ZooBank LSIDs (Life Science Identifiers) can be resolved and the associated information viewed
128 through any standard web browser by appending the LSID to the prefix <http://zoobank.org/>. The
129 LSID for this publication is urn:lsid:zoobank.org:pub:0612FF19-38E8-4072-AF74-
130 0EB16165841. The online version of this work is archived and available from the following
131 digital repositories: PeerJ, PubMed Central and CLOCKSS.

133 **Results**

134

135 Taxonomy

136

137 **Lendatus Chatzimanolis, new genus**

138 (Figs. 1, 2, 3, 4, 5, 6, 7, 8, 9)

139

140 urn:lsid:zoobank.org:act:73EEC4F3-E35B-4E67-9FAA-5C8C14222ABB

141

142 **Type Species.** *Lendatus platys*, new species, here designated.

143

144 **Diagnosis.** *Lendatus* belongs to the *Isanopus* group of genera (see Chatzimanolis and Brunke
145 2019 for characters differentiating all genera in the *Isanopus* group) based on the following
146 morphological characteristics: basal transverse carina on sternum 3 acutely pointed medially;
147 lack of dense meshed microsculpture on sterna 5–7 (Fig. 4C); antennomeres 8–10 quadrate or
148 elongate (Fig. 3E); and mesocoxae moderately to strongly separated (Fig. 4B). *Lendatus* was
149 recovered as the sister group to *Isanopus* (Chatzimanolis 2014; Chatzimanolis and Brunke 2019)
150 and the sister group relationship is supported by the following morphological characteristics
151 (besides the molecular data supporting that relationship): coarse punctures impressed in flange at
152 posterior angle of pronotum (Fig. 2); and lateral area of basal transverse carina on sternum 3
153 sinuate. Synapomorphies for *Lendatus* include: apical setae on paramere long, produced over the
154 median lobe (Figs. 5, 6, 7), longer than any other Xanthopygina genus; and distribution of
155 punctures on disc of pronotum split into anterior and posterior parts by diagonal longitudinal
156 line, a unique character state in Xanthopygina. Additional characteristics that can distinguish
157 *Lendatus* from *Isanopus* include: paramere not extremely reduced (as in *Isanopus*) and
158 tarsomeres of middle and hind legs not enlarged and lobed (as in *Isanopus*).

159 Some species of *Oligotergus* Bierig may look superficially similar to *Lendatus*, but
160 species in that genus typically lack the characteristics of the *Isanopus* group. Additionally, *L.*
161 *philothalpiformis* has the same color pattern with some *Philothalpus* Kraatz species but
162 *Philothalpus* can be easily distinguished by the presence of a pair of accessory ridges on the
163 anterior basal transverse carina of tergum 3 (see Chani-Pose et al. 2018).

164

165 **Description.** Habitus as in Fig. 1. Body medium-sized, forebody 4.6–5.8 mm long; without long
166 bristle-like setae. Coloration of head and pronotum dark brown to black with metallic overtones
167 or bright reddish-orange; elytra dark metallic green, blue or purple; abdomen dark brown or
168 reddish brown to dark brown.

169 Head (Fig. 2) shape rectangular; head length in comparison to pronotum shorter to
170 subequal. Eye size relative to length of head large, more than 3/4 length of head. Postclypeus in
171 comparison to frons not deflexed, anterior margin more or less straight. Middle of epicranium
172 impunctate but with microsculpture. Postmandibular ridge laterally; with deep punctures
173 demarcating raised postmandibular ridge dorsolaterally present. Gular sutures not joined before
174 neck extended close to each other at base of head capsule. Nuchal ridge present. Neck disc
175 punctures sparse.

176 Antennae (Fig. 3E), antennomere 1 same width or slightly wider than 2. Antennomere 3
177 elongate, three times as long as wide; antennomere 4 with tomentose pubescence; antennomere 6
178 with curved, distinctly longer and thicker subapical setae than other macrosetae, forming circlet;

- 179 antennomeres 1–11, cylindrical, longer than wide; antennomeres 8–10 symmetrical;
180 antennomeres 5–10 without club; antennomere 11 in males subequal to 10.
- 181 Mouthparts with labrum having broad U-shaped emargination, lobes strongly separated.
182 Mandibles (Figs. 3A–B) relative length typical (i.e. closed mandible not extending beyond
183 margin lateral margin of head); without asymmetrical torsion. Mandibles in dorsal view curved
184 from apical half; in lateral view straight; left and right mandibles each with one tooth. Maxilla
185 (Fig. 3D) with galea much shorter than palpus; maxillary palpus with P_3 distinctly shorter than P_2 ;
186 P_4 distinctly longer than P_3 ; P_4 not dilated. Hypopharynx and labial palpi as in Fig. 3C; labial
187 palpus P_3 widest before apex, without long dense setae on entire lateral sides. Ligula small, entire.
188 Mentum with alpha setae present; hypostomal cavity present, moderately delimited.
- 189 Pronotum (Fig. 2) shape of lateral margins in dorsal view posteriad of midpoint straight
190 to sinuate (except *L. platys* convex); anterior angles in dorsal view not strongly acuminate and
191 produced laterad. Pronotum near anterolateral angles without raised impunctate spots;
192 anterolateral corners with punctuation; disc of pronotum with punctuation split into anterior and
193 posterior parts by diagonal longitudinal line of punctures; with coarse punctures impressed in
194 flange at posterior angle of pronotum; with microsculpture. Pronotum subquadrate; narrower
195 than head at widest points. Hypomeron (Fig. 4A) with superior marginal line continuous to
196 anterior margin; superior marginal line without deflection under anterior angles in ventral view;
197 inferior marginal line continued as a separate entity beyond anterior pronotal angles and curving
198 around them. Postcoxal process absent. Basisternum slightly longer than furcasternum;
199 basisternum with pair of macrosetae situated far from anterior margin of prosternum.
- 200 Elytra without contiguous polygon-shaped meshed microsculpture or patches of white
201 setae. Elytral setae not reduced, easily seen at low magnification (e.g., 40x). Mesoventrite (Fig.
202 4B) with anterior margin forming “lip”; without median carina; mesoventral process triangular;
203 process extended distally to distance about 2/5 between mesocoxae. Metaventrite (Fig. 4B) with
204 large punctures; metaventral processes, small, rounded, triangular, extended to beginning of
205 metacoxae.
- 206 Legs with tarsal segmentation 5-5-5; prefemora without lateroventral apical spines;
207 protarsi with modified pale (adhesive) setae ventrally; tarsomeres 1–4 of protarsi dorsoventrally
208 flattened. Mesocoxae (Fig. 4B) moderately separated; intercoxal area distinctly recessed
209 compared to mesoventral process. Metacoxae without coxal shield; metatibia without thick and
210 long apical spurs but with smaller spurs and spines. Meso/metatarsi without asymmetrically
211 lobed tarsomeres 1–4; tarsomeres 3–5 of metatarsi with chaetotaxy developed only at margins of
212 dorsal surface, dorsal surface of tarsomeres glabrous along midline. Pretarsal claws with
213 empodial setae.
- 214 Abdomen (Figs. 4C–D) with protergal glands having well-developed acetabula. Anterior
215 basal transverse carina on terga 3–5 without pair of accessory ridges; tergum 3 without posterior
216 basal transverse carina and without curved carina (arch-like) on disc; center of tergum 5 with
217 punctuation; posterior half of tergum 5 in lateral view not appearing bulging. Sternum 3 with
218 acutely pointed basal transverse carina medially; laterally basal transverse carina sinuate; basal
219 transverse carina absent on sternum 4; sternum 5 without dense, meshed microsculpture
220 anterolaterally; sternum 7 with sparse punctuation laterally. Males with secondary sexual
221 structures (emargination medially on sterna 7 and 8); without porose structure. Females without
222 obvious secondary sexual structures.

223 Aedeagus as in Figs. 5–7; with long median lobe and single paramere; paramere with
224 sensory peg setae and long apical setae; median lobe with single subapical tooth; median lobe
225 without apical tooth, carina or paired apex. Spermatheca not sclerotized.

226

227 **Etymology.** The name is in honor of my dear friends Dr. Ntina Karametsi, Dr. Lia Koutelou, Mr.
228 Dimitris Kotsis, Dr. Tania Patsialou and Dr. Eleni Zika. The name is made up from a
229 combination of letters from the first names. The name is masculine.

230

231 **Habitat.** Collected in lowland tropical rainforests and mid-elevation cloud forests using a variety
232 of trapping techniques and by shifting leaf litter. The genus most likely inhabits the leaf litter.

240 **Type material. Holotype**, here designated, male, “Bolivia: La Paz, 9.4 km E. Chulumani, Apa-
241 Apa, 2400 m, 16°20.99S 67°30.30W [-16.349833, -067.505], 17.i.2001, R. Anderson, upper
242 yungas litter, BOLA01-002” / “SM0459200 [barcode label]” / “HOLOTYPE *Lendatus*
243 *bolivianus* Chatzimanolis, des. Chatzimanolis 2019”. In the collection of SEMC.

244

245 **Paratypes.** Six; one with same locality label as holotype and barcode label SM0459190 (1♀
246 SEMC); “Bolivia: La Paz Prov. Chulumani, 9.2 km E of, 2300 m, 16°20.59S 67°30.18W [-
247 16.3431667, -67.503], 19–21 Jan[uary] 2001, J. S. Ashe, R. S. Hanley, BOL1AH01 039 ex:
248 flight intercept trap” / “SM0236239” (1♂ SEMC); “Bolivia: La Paz 9.4 km E Chulumani, 2200
249 m, 16°20.99S 67°30.30W [-16.349833, -067.505], 19–21.i.2001, J. S. Ashe, R. S. Hanley,
250 BOL1AH01 038 ex: flight intercept trap” / SM0574084, SM236231 (1♀ SEMC; 1♀ UTCI);
251 “Bolivia: Chulumani, Apa-Apa forest, 16°21’S, 67°30’W [-16.35, -67.5], 12–14.xi.2007, 2000
252 m, shifting forest litter, V. Grebennikov leg.” (1♀, 1♂ NHMD). All paratypes with label
253 “PARATYPE *Lendatus bolivianus* Chatzimanolis, des. Chatzimanolis 2019”.

254

255 **Diagnosis.** *Lendatus bolivianus* and *L. platys* can be distinguished from *L. philothalpiformis* by
256 the coloration of head and pronotum (dark brown to black in *L. bolivianus* and *L. platys*; bright
257 reddish-orange in *L. philothalpiformis*). *Lendatus bolivianus* can be distinguished from *L. platys*
258 by the shape of the pronotum (becoming narrower (concave) posteriorly (Fig. 2A) in *L.*
259 *bolivianus*; becoming wide (convex) posteriorly (Fig. 2C) in *L. platys*); the shape of the paramere
260 (paramere wider, converging to apex in dorsal view (Fig. 5B) in *L. bolivianus*; paramere
261 narrower, parallel-sided from base to apex in dorsal view (Fig. 7B) in *L. platys*); and the length
262 comparison between the anterior portion of the paramere and median lobe (median lobe slightly
263 longer than paramere (Figs. 5A–B) in *L. bolivianus*; median lobe much longer than paramere
264 (Figs. 7A–B) in *L. platys*).

265

266 **Description.** Forebody length 4.9–5.5 mm. Coloration of head, pronotum and ventral side of
267 body dark brown to black; mouthparts and antennae dark orange; elytra metallic purple with
268 green overtones; legs dark brown except tarsi dark orange; abdomen dark brown to black except
269 segment 7 (posterior 1/4 orange) and segment 8 (orange).

270 Head with 1–2 irregular rows of medium-sized punctures on each side of central
271 impunctate area (except anteriorly); with additional 3–4 large punctures on epicranium; with
272 microsculpture and micropunctures. Head width/length ratio = 1.61. Pronotum width/length ratio
273 = 0.95; pronotum widest anteriorly, becoming gradually narrower posteriad; diagonal
274 longitudinal line of punctures on disc of pronotum with 3–4 large punctures; anterolateral to that
275 line pronotum with 5–6 medium-sized punctures; posterolateral to that line pronotum
276 impunctate; pronotum with microsculpture and sparse micropunctures; pronotum/elytra length
277 ration = 0.82. Males with narrow, deep emargination on sternum 7; sternum 8 with deep U-
278 shaped emargination.

279 Aedeagus as in Fig. 5; paramere in dorsal view gradually converging to rounded apex; in
280 lateral view paramere slightly convex, converging to broadly rounded apex; paramere with peg
281 setae as in Fig. 5C; paramere narrower but slightly longer than median lobe; median lobe in
282 dorsal view converging to apex; in lateral view median lobe becoming narrower from middle to
283 apex; with small dorsal subapical tooth.

284
285 **Distribution.** Known from the province of La Paz in Bolivia.
286

287 **Habitat.** All specimens were collected in the Yungas forest along eastern slope of the Andes
288 Mountains in Bolivia (at elevations of 2000 m or above) by shifting litter or flight intercept traps.
289

290 **Etymology.** The specific epithet refers to the country of Bolivia.

431 paratypes with label “PARATYPE *Lendatus philothalpiformis* Chatzimanolis, des.
432 Chatzimanolis 2019”.

433

434 **Diagnosis.** *Lendatus philothalpiformis* can be easily recognized among the existing species in
435 the genus due to the bright reddish-orange coloration of the head and pronotum. Additionally, it
436 is the only species known with a Central American distribution.

437

438 **Description.** Forebody length 4.6–5.8 mm. Coloration of head, pronotum and prosternum bright
439 reddish-orange (in few specimens brown); mouthparts, antennae and legs reddish-orange to
440 brown; elytra metallic green or blue; meso- and metaventrite brown; abdomen reddish-orange to
441 brown (frequently with segment 6 dark brown) except segment 7 dark brown with posterior 1/3
442 orange and segment 8 orange.

443 Head with 1–2 irregular rows of large punctures on each side of central impunctate area
444 (except anteriorly); with additional 3–4 large punctures on epicranium; with microsculpture and
445 micropunctures. Head width/length ratio = 1.5. Pronotum width/length ratio = 0.92; pronotum
446 widest anteriorly, becoming strongly narrower (concave) posteriad; diagonal longitudinal line of
447 punctures on disc of pronotum with 3–4 large punctures; anterolateral to that line pronotum with
448 less than 5 large punctures; posterolateral to that line pronotum impunctate; pronotum with
449 microsculpture and micropunctures; pronotum/elytra length ration = 0.92. Males with broad,
450 shallow margination on sternum 7 (Fig. 4C); sternum 8 with shallow V-shaped emargination.

451 Aedeagus as in Fig. 6; paramere in dorsal view almost parallel-sided but apex wider; in
452 lateral view paramere slightly convex, converging to narrow rounded apex; paramere with peg
453 setae as in Fig. 6C; paramere narrower than median lobe except just before apex; paramere
454 longer than median lobe; median lobe in dorsal view converging to apex; in lateral view median

455 lobe becoming narrower from middle to narrowly elongate apex; with large dorsal subapical
456 tooth.

457

458 **Distribution.** Known from many provinces in Costa Rica and the provinces of Bocas del Toro
459 and Chiriquí in Panama.

460

461 **Habitat.** Specimens were collected with malaise, pitfall and flight intercept traps and by shifting
462 leaf litter in wet tropical lowland forests or tropical cloud forests at elevations of 5–1950 m).

463

464 **Etymology.** The specific epithet is derived from the words *Philothalpus* and *formis* and refers to
465 the superficial resemblance of this species to species in the genus *Philothalpus*.

535 Chatzimanolis, des. Chatzimanolis 2019”.
536

537 **Diagnosis.** *Lendatus platys* and *L. bolivianus* can be distinguished from *L. philothalpiformis* by
538 the coloration of head and pronotum (dark brown to black in *L. bolivianus* and *L. platys*; bright
539 reddish-orange in *L. philothalpiformis*). *Lendatus platys* can be distinguished from *L. bolivianus*
540 by the shape of the pronotum (becoming wide (convex) posteriorly (Fig. 2C) in *L. platys*;
541 becoming narrower (concave) posteriorly (Fig. 2A) in *L. bolivianus*); the shape of the paramere
542 (paramere narrower, parallel-sided from base to apex in dorsal view (Fig. 7B) in *L. platys*;
543 paramere wider, converging to apex in dorsal view (Fig. 5B) in *L. bolivianus*;) and the length
544 comparison between the anterior portion of the paramere and median lobe (median lobe much
545 longer than paramere (Figs. 7A–B) in *L. platys*; median lobe slightly longer than paramere (Figs.
546 5A–B) in *L. bolivianus*).
547

548 **Description.** Forebody length 4.7–5.6 mm. Coloration of head, pronotum and ventral side of
549 body dark brown to black; mouthparts and antennae dark orange to brown; elytra metallic blue,
550 green or purple (blue most commonly); legs dark brown except tarsi dark orange; abdomen dark
551 brown to black except segment 7 (posterior 1/3 orange) and segment 8 (orange).

552 Head with 2–3 irregular rows of medium-sized punctures on each side of central
553 impunctate area (except anteriorly); with additional 4–6 large punctures on epicranium; with
554 microsculpture and micropunctures. Head width/length ratio = 1.53. Pronotum width/length ratio
555 = 1.02; pronotum widest medially, lateral sides of pronotum convex; diagonal longitudinal line
556 of punctures on disc of pronotum with 5–6 large punctures; anterolateral to that line pronotum
557 with 5–8 medium-sized punctures; posterolateral to that line pronotum impunctate; pronotum
558 with microsculpture and micropunctures; pronotum/elytra length ration = 0.89. Males with
559 narrow, deep emargination on sternum 7; sternum 8 with deep U-shaped emargination.

560 Aedeagus as in Fig. 7; paramere in dorsal view almost parallel-sided but apex slightly
561 wider; in lateral view paramere convex, converging to broadly rounded apex; paramere with peg
562 setae as in Fig. 7C; paramere narrower but longer than median lobe; median lobe in dorsal view
563 converging to apex; in lateral view median lobe becoming narrower from middle to narrowly
564 elongate apex; with small dorsal subapical tooth.

565
566 **Distribution.** Known from the department of Santa Cruz in Bolivia, the provinces of Morona-
567 Santiago, Napo, Orellano and Sucumbios in Ecuador, and the departments of Cusco, Loreto,
568 Junín, Madre de Dios and Ucauali in Peru.

569
570 **Habitat.** Specimens were collected with malaise, baited pitfall and flight intercept traps and by
571 shifting leaf litter in wet tropical lowland forests or tropical cloud forests at elevations of 10–
572 1300 m).

573
574 **Etymology.** The specific epithet is derived from the Greek word πλατύς (wide) and refers to the
575 wide shape of the pronotum.

576
577 **Remarks.** An additional specimen from Colombia [Colombia: Valle del Cauca, PNN Farallones
578 de Cali, Anchicaya, 3°26'N 76°48'W, 730 m, 27.ii.–27.iii.2001, Malaise, S. Sarria leg., M1538”
579 / “SM0548730”(1♀ SEMC)] looks almost identical to this species, except that the pronotum is
580 not as wide as the other specimens in this species. Unfortunately, this specimen is female and
581 thus I cannot place it with certainty in *L. platys*.

- 582
583
584 **Key to the species of *Lendatus***
585
586 1. Color of head and pronotum (Fig. 2B) bright reddish-orange (rarely brown); distributed
587 in Central America (Fig. 9) ... *Lendatus philothalpiformis*
588
589 - Color of head and pronotum dark brown to black (Figs. 2A, C); distributed in South
590 America (Fig. 8) 2
591

- 592 2. Pronotum becoming narrower (concave) posteriorly (Fig. 2A); paramere wider,
593 converging to apex in dorsal view (Fig. 5B); anterior portion of median lobe slightly longer than
594 paramere (Figs. 5A–B) ... *Lendatus bolivianus*
- 595
- 596 - Pronotum becoming wide (convex) posteriorly (Fig. 2C); paramere narrower, parallel-
597 sided from base to apex in dorsal view (Fig. 7B); anterior portion of median lobe much longer
598 than paramere (Figs. 7A–B) ... *Lendatus platys*

602 Acknowledgements

603

604 I thank all the curators and collection managers listed in the materials examined section for
605 access to the specimens. I thank Adam Brunke, Aslak Kappel Hansen and an anonymous
606 reviewer for comments that improved this manuscript. I thank Max Marlowe for taking some of
607 the photographs shown in this paper.
