

Basic reporting:

By constructing a RAPA framework based on LOOCV and SARIMA, this paper analyzed the relationship between disciplinary network attention and literature research, and provided their own predictions. This paper is an interesting work and a good attempt to combine traditional CNKI data with Baidu big data. The paper contains good potential, but there are also some issues. I think the paper needs further improvement.

1. Compared with previous research methods, the highlights of this study are not yet prominent, which is the basis to understand the novelty of this paper.
2. The justification to design/choose these keywords related to educational disciplines?
3. The authors need to explain why they have considered the Baidu Index in their analysis.
4. The RAPA method framework section should be elaborated in detail.
5. Improve the quality of Figure 5 and enlarge the font. It's blurry and small for readers to get information from the figures.
6. Paper should be checked for English spelling/minor grammatical mistakes.
7. Enrich the reference list to ensure that the literature review includes the most recent and relevant studies.

Experimental design:
